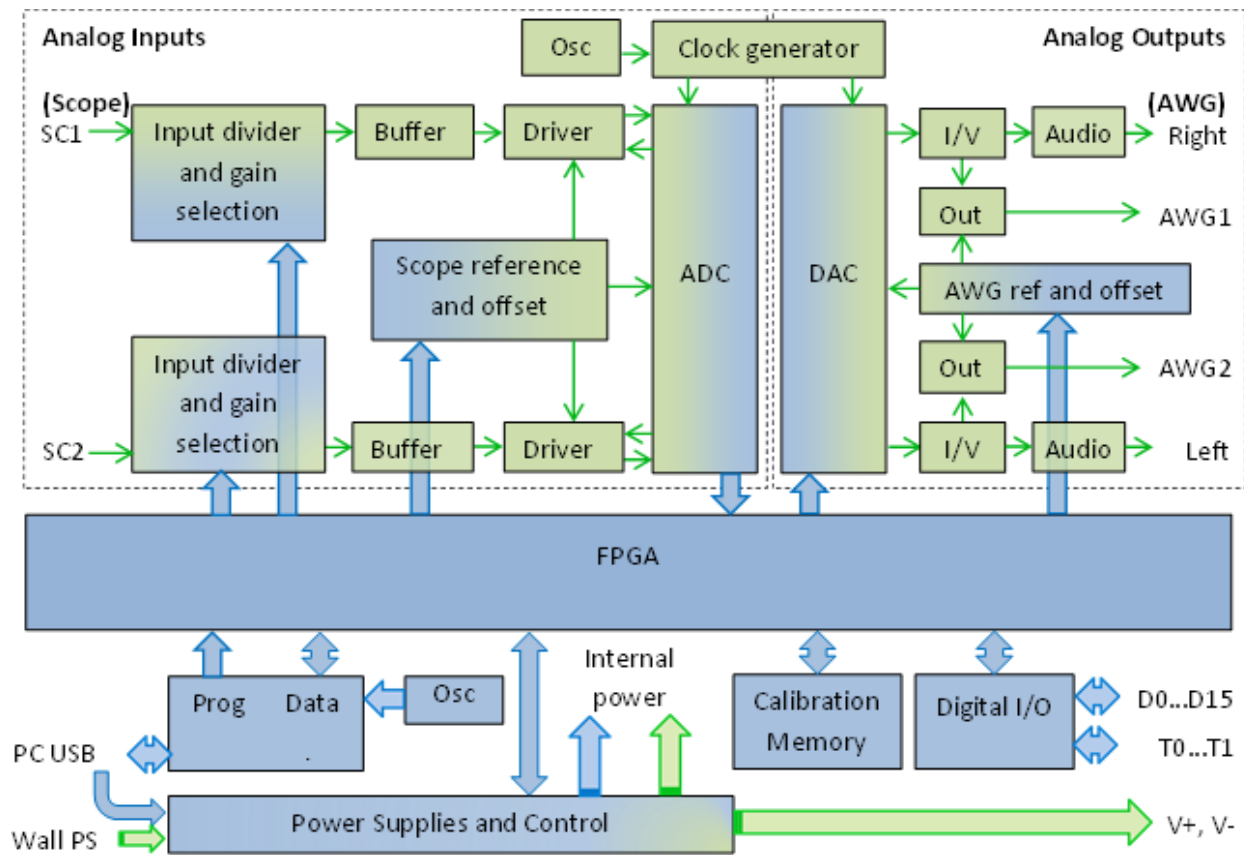

Figure 2. Analog Discovery 2 block diagram.

2 Scope

Unlike traditional inexpensive scopes, the Analog Discovery 2 inputs are fully differential. However, a GND connection to the circuit under test is needed to provide a stable common mode voltage. The Analog Discovery 2 GND reference is connected to the USB GND. Depending on the PC powering scheme, and other PC connections (Ethernet, audio, etc. – which might also be grounded) the Analog Discovery 2 GND reference might be connected to the whole GND system and ultimately to the power network protection (earth ground). The circuit under test might also be connected to earth or possibly floating. For safety reasons, it is the user's responsibility to understand the powering and grounding scheme and make sure that there is a common GND reference between the Analog Discovery 2 and the circuit under test, and that the common mode and differential voltages do not exceed the limits shown in equation (1). Furthermore, for distortion-free measurements, the common mode and differential voltages need to fit into the linear range shown in Figs. 12 and 13. For those applications which scope GND cannot be the USB ground, a USB isolation solution, such as what is described in ADI's CN-0160 can be used; however, this will limit things to USB full speed (12 Mbps), and will impact the update rate (screen refresh rates, not sample rates) of the Analog Discovery 2.

- V_{outAWG} is the output voltage of the AWG.

where R_{140} , R_{141} , R_{144} , R_{147} , and R_{149} are the resistances of the resistors in the circuit.

$$\frac{1}{R_{140}} + \frac{1}{R_{141}} + \frac{1}{R_{144}} = \frac{1}{R_{147}} + \frac{1}{R_{149}} \quad (36)$$

$$V_{outAWG} = -V_{Audio} \cdot \frac{R_{141}}{R_{144}} + (2 \cdot V_{offAWG} - V_{ref1V2AWG}) \cdot \frac{R_{141}}{R_{140}} \quad (37)$$

where V_{offAWG} and $V_{ref1V2AWG}$ are the offset and reference voltages of the AWG.

6.4 User Voltage Supplies

The user voltage supplies are implemented using two operational amplifiers (op-amps) configured as voltage followers. The op-amps are powered by the internal 1.235V supply and the external 5.33V supply. The user voltage supplies are configured as follows:

- The positive user voltage supply is configured as a voltage follower with a gain of 1.
- The negative user voltage supply is configured as a voltage follower with a gain of -1.
- The user voltage supplies are powered by the internal 1.235V supply and the external 5.33V supply.
- The user voltage supplies are configured to provide a maximum output voltage of 1.2V.
- The user voltage supplies are configured to provide a minimum output voltage of -1.2V.
- The user voltage supplies are configured to provide a maximum output current of 10mA.

The user voltage supplies are implemented using two operational amplifiers (op-amps) configured as voltage followers. The op-amps are powered by the internal 1.235V supply and the external 5.33V supply. The user voltage supplies are configured as follows:

The user voltage supplies are implemented using two operational amplifiers (op-amps) configured as voltage followers. The op-amps are powered by the internal 1.235V supply and the external 5.33V supply. The user voltage supplies are configured as follows:

$$V_{+IC46A} = \frac{\frac{V_{OUT+USR}}{R_{188}} + \frac{V_{SET+USR}}{R_{193}}}{\frac{1}{R_{188}} + \frac{1}{R_{193}}} = V_{-IC46A} = \frac{\frac{V_{FB}}{R_{266}}}{\frac{1}{R_{265}} + \frac{1}{R_{266}}} \quad (56)$$

$$V_{+IC46B} = \frac{\frac{V_{OUT-USR}}{R_{187}} + \frac{V_{FB}}{R_{270}}}{\frac{1}{R_{187}} + \frac{1}{R_{270}}} = V_{-IC46B} = \frac{\frac{V_{SET-USR}}{R_{190}}}{\frac{1}{R_{72}} + \frac{1}{R_{190}}} \quad (57)$$

The user voltage supplies are implemented using two operational amplifiers (op-amps) configured as voltage followers. The op-amps are powered by the internal 1.235V supply and the external 5.33V supply. The user voltage supplies are configured as follows:

$$\frac{1}{R_{188}} + \frac{1}{R_{193}} = \frac{1}{R_{265}} + \frac{1}{R_{266}} \quad (58)$$

$$\frac{1}{R_{187}} + \frac{1}{R_{270}} = \frac{1}{R_{72}} + \frac{1}{R_{190}} \quad (59)$$

The user voltage supplies are implemented using two operational amplifiers (op-amps) configured as voltage followers. The op-amps are powered by the internal 1.235V supply and the external 5.33V supply. The user voltage supplies are configured as follows:

$$V_{OUT+USR} = V_{FB} \cdot \frac{R_{188}}{R_{266}} - V_{SET+USR} \cdot \frac{R_{188}}{R_{193}} = 5.33V - 4.87 \cdot V_{SET+USR} \quad (60)$$

$$V_{OUT-USR} = -V_{FB} \cdot \frac{R_{187}}{R_{270}} + V_{SET-USR} \cdot \frac{R_{187}}{R_{190}} = -5.33V + 4.87 \cdot V_{SET-USR} \quad (61)$$

The user voltage supplies are implemented using two operational amplifiers (op-amps) configured as voltage followers. The op-amps are powered by the internal 1.235V supply and the external 5.33V supply. The user voltage supplies are configured as follows:

$$V_{FB} = 1.235V \text{ typical} \quad (62)$$

The user voltage supplies are implemented using two operational amplifiers (op-amps) configured as voltage followers. The op-amps are powered by the internal 1.235V supply and the external 5.33V supply. The user voltage supplies are configured as follows:

$$0 < V_{SET+USR}, V_{SET-USR} < 1.2V \quad (63)$$

The user voltage supplies are implemented using two operational amplifiers (op-amps) configured as voltage followers. The op-amps are powered by the internal 1.235V supply and the external 5.33V supply. The user voltage supplies are configured as follows:

$$-0.51V \leq V_{OUT+USR} < 5.33V \quad (64)$$

$$0.51V \geq V_{OUT+USR} > -5.33V \quad (65)$$
