

7 Series FPGAs Packaging and Pinout

Product Specification

UG475 (v1.18) July 16, 2019

Revision History

The following table shows the revision history for this document.

Date	Version	Revision
7/16/2019	1.18	<p>Added the XA7K160T-FFG676 device specifications throughout the document.</p> <p>In Chapter 1: Updated description of the Pb-free character markings on page 16. In Table 1-8, revised the user I/O for the CPG238 package to 112 (from 110). Added the RSVDGND pins to Table 1-12. Updated the XC7A12T, XA7A12T, XC7A25T, and XA7A25T Banks CSG325 Package description.</p> <p>In Chapter 3: Updated the FTGB196 Package—XC7S6 and XC7S15 and FTGB196 Package—XC7S25 and XC7S50 sections to show the available devices. Added RSVDGND to Figure 3-53.</p> <p>In Chapter 5: Updated Table 5-1 to show the devices offered in the FTGB196 package (removed the XA7S6, XA7S15, XA7S25, and XA7S50).</p>
8/17/2018	1.17	<p>In Chapter 1: Added XA devices to Table 1-7. Added an Important note about Tandem PROM configuration on page 28. Updated the Die Level Bank Numbering Overview section to include the XA Spartan-7 devices.</p> <p>In Chapter 2: Updated the links to individual ZIP files in Table 2-1 and moved the status to production on many of the devices.</p> <p>In Chapter 3: Added XA Spartan-7 devices to Table 3-1. Where applicable, added the XA devices.</p>
3/14/2018	1.16	<p>In Chapter 2: Updated the links to individual ZIP files in Table 2-1 and Table 2-2.</p> <p>In Chapter 3: Added XC7A12T, XC7A25T, and Spartan-7 device diagrams.</p> <p>In Chapter 4: In response to XCN16004: Forged to Stamped Lid Conversion for Monolithic FPGA Flip Chip Packages, added Figure 4-34: FF900 and FFG900 (XC7K325T and XC7K410T) Flip-Chip BGA (1.0 mm Pitch) with Stamped Lid and Figure 4-36: FF1156 and FFG1156 (XC7K420T and XC7K480T) Flip-Chip BGA (1.0 mm Pitch) with Stamped Lid.</p>

Date	Version	Revision
7/24/2017	1.15	<p>Added the XC/XA Spartan-7 devices, the XC7A12T/XA7A12T and XC7A25T/XA7A25T devices, and the CPG238 package. Removed the .</p> <p>In Chapter 1: Added an Important note on page 22. Updated the DDR DQS strobe pin direction in Table 1-12. Added the Migrating between Devices section. Updated the CPG236 package on page 41. Corrected the package list in XC7VX485T and XQ7VX485T Banks.</p> <p>In Chapter 2: Added Package Specifications Designations section.</p> <p>In Chapter 4: Revised Figure 4-47, the RF1761 mechanical drawing.</p> <p>In Chapter 5: Added devices to Table 5-1. In Table 5-3, changed the Peak Package Reflow Body Temperature for some packages to 245°C.</p> <p>In Chapter 6: Added Figure 6-1: Spartan-7 Device Package Marking. Updated Figure 6-2, Figure 6-3, and Figure 6-4 to add the bar code marking and the Pb-free character. Added the Pb-free Character description as outlined in XCN16022:</p> <p>Revised the Bar Code section of Table 6-1 to include changes outlined in XCN16014:</p> <p>In Chapter 7: Added packages to Table 7-1.</p> <p>Added Appendix C, Additional Resources and Legal Notices. Moved the Disclaimer Notices and References sections to Appendix C.</p>
3/23/2016	1.14	<p>Updated to add the XQ7VX690T in the RF1158 package. Added RoHS compliant options (FFV packages) where applicable.</p> <p>In Table 1-12, updated the SRCC description.</p> <p>Updated Figure 4-7 with solder ball composition changes. Refined the A2 dimensions in Figure 4-12 and Figure 4-22. Added the FFV1761 package (Figure 4-42). Added the RF1158 to Figure 4-46.</p> <p>Completely revised Chapter 5, Thermal Specifications with industry standard guidelines for all sections. Updated the Thermal Management Strategy section.</p> <p>Updated the Thermal Interface Material section previously in Appendix B. Added the Applied Pressure from Heat Sink to the Package via Thermal Interface Materials section.</p> <p>In Appendix B: Moved and renamed the section to Chapter 5. Removed the section.</p>
11/13/2014	1.13	Added XC7A15T and XA7A15T devices throughout the specification.
10/28/2014	1.12	<p>Added a discussion on ULA materials on page 17. Added clarifications with regards to Artix-7 devices throughout the document including Pin Compatibility between Packages and Note 1 to Table 3-2. Updated on page 73.</p> <p>In Table 5-2 and Figure 5-7, revised the Peak temperature (body) values and the Ramp-up rate and Ramp-down rate to 2°C/s. Removed references to CL/CLG packages in Table 5-3 and Appendix A. Updated Figure 5-4. Also added the Peak Package Reflow Body Temperature values to Table 5-3. Added Heat Sink Removal Procedure, Package Pressure Handling Capacity, Post Reflow/Cleaning/Washing, and Conformal Coating.</p> <p>Added Chapter 7, Packing and Shipping.</p>

Date	Version	Revision
3/18/2014	1.11	<p>Added the XC7A35T, XC7A50T, and XC7A75T throughout document including Table 1-3, Table 1-8, Figure 1-6, Figure 1-7, Figure 1-8, Table 2-2, Table 3-2, Table 5-1, and added or updated Figure 3-41 through Figure 3-80. Also added the automotive XA Artix-7 FPGA versions (XA7A35T, XA7A50T, XA7A75T, and XA7A100T) and the defense-graded Artix-7Q device (XQ7A50T) with applicable packages.</p> <p>In Table 1-1, updated Note 1. In Table 1-12, updated Note 2 and the description of PUDC_B.</p> <p>Added links to all the ruggedized packages in Chapter 2, 7 Series FPGAs Package Files.</p> <p>Updated the DCI pin description in the legends for all the Memory Groupings diagrams in Chapter 3, Device Diagrams.</p> <p>Added CPG236 package to document including Figure 4-7, Table 5-1, and Table A-1. Added CSG325 to document including updating Figure 4-9. This update includes a change in the A₂ dimensions for the CSG324. Replaced Figure 4-16: FG484 and FGG484 Wire-bond Fine-Pitch BGA Package Specification for Artix-7 FPGAs, page 276 with a new drawing with updated dimensions. Replaced Figure 4-17: FG676 and FGG676 Wire-bond Fine-Pitch BGA Package Specification for Artix-7 FPGAs, page 277 with a new drawing with an updated mechanical drawing. Updated the M specification in Figure 4-19: RB484 Ruggedized Flip-Chip BGA Package Specifications for Artix-7 FPGAs, page 279. Replaced Figure 4-33: FF676, FFG676, and FFV676 Flip-Chip BGA Package Specifications for Kintex-7 FPGAs, page 293 with a new drawing where the lid is updated with four corner posts.</p> <p>Updated the References links in Chapter 5, Thermal Specifications.</p> <p>Revised the M diameter for FF/FFG, FB/FBG, FH/FHG, FL/FLG, and RF/RB/RS packages in Table A-1.</p>
11/15/2013	1.10	<p>Updated disclaimer.</p> <p>Added the XQ devices and RB/RF/RS package information throughout document.</p> <p>Added Note 1 to Table 1-2 and Note 6 to Table 1-12. Revised the super logic region numbers in Figure 1-20.</p> <p>Removed the Virtex-7 HT devices (HCG packages). Before removal, revised the super logic region numbers in Figure 1-20: XC7VH870T Banks. For packaging and pinout information on the Virtex-7 HT devices see www.xilinx.com/member/gtz/index.htm.</p> <p>Updated the legend in Figure 3-141, Figure 3-144, Figure 3-145, Figure 3-148, Figure 3-209, Figure 3-212, Figure 3-213, Figure 3-216, Figure 3-217, and Figure 3-220.</p> <p>Updated the A and A2 dimensions in Figure 4-18: FF1156, FFG1156, and FFV1156 Flip-Chip BGA Package Specification for Artix-7 FPGAs, page 278.</p> <p>Added Note 1 and updated the data in Table 5-1. Updated the Pb-Free Reflow Soldering in Chapter 5 discussion.</p> <p>Removed the engineering sample notation from the top mark drawings in Figure 6-2, Figure 6-3, and Figure 6-4. Updated the L2E description in Table 6-1.</p> <p>Updated Appendix A.</p>

Date	Version	Revision
2/14/2013	1.9	<p>Clarified pins in Figure 3-89.</p> <p>Updated Figure 4-18 and Figure 4-22 and added Figure 4-23 and Figure 4-24.</p> <p>Revised Figure 4-35 and Figure 4-40.</p> <p>In Table 5-1, updated data for Artix-7 FPGAs, XC7K160T FF/FFG/FFV676, Virtex-7 T FPGAs and XC7VX1140T.</p> <p>Updated Appendix B.</p>
10/15/2012	1.8	<p>Removed the following devices: XC7A350T, XC7V1500T, XC7VH290T.</p> <p>Added Figure 4-26 and updated drawing in Figure 4-27. Added Note 5 to Figure 4-40. Updated A2 dimension in Figure 4-44. Updated the aaa dimension in Figure 4-43 and Figure 4-45.</p> <p>Updated the JEDEC Moisture Sensitivity Level (MSL) for the Flip-Chip packages on page 326.</p>
7/20/2012	1.7	<p>In Table 1-12, updated the Other Pins section.</p> <p>Added the XC7VH290T, XC7VH580T, and XC7VH870T and associated HCG packages to all appropriate chapters, tables, and figures. Added the SBG484 package for the XC7A200T devices to all appropriate chapters, tables, and figures.</p> <p>Updated the XC7VX1140T-FLG1926 headings in Table 2-5, Figure 3-209 through Figure 3-212, and Figure 4-45.</p> <p>Updated GTP Quad numbers in Figure 1-9, Figure 3-74, and Figure 3-78. Also added numbers to Figure 3-77 and Figure 3-80. Updated the XC7V585T-FFG1761 figures: Figure 3-137 and Figure 3-140.</p> <p>Added new mechanical drawings for the Artix-7 FPGAs in Chapter 4 along with Figure 4-27, Figure 4-35, and Figure 4-36, and updated Figure 4-35.</p> <p>In Table 5-1, updated data throughout and added XC7VX1140T (FL1926) and XC7VH580T data.</p> <p>Added Figure 6-2: Artix-7 Device Package Marking.</p>

Date	Version	Revision
5/24/2012	1.6	<p>Removed the FFG1933 and FLG1933 packages throughout. Added the FLG1926 package where appropriate.</p> <p>Updated the Introduction in Chapter 1. Updated XC7K420T in Table 1-10. Added Note 7 to Table 1-12. Updated the description and figure in the XC7K420T Banks and XC7VX550T Banks sections.</p> <p>Updated Figure 3-86, Figure 3-90, Figure 3-94, and Figure 3-34. Added Figure 3-209 through Figure 3-212.</p> <p>Added Figure 4-14: FB676, FBG676, and FBV676 Flip-Chip Lidless BGA Package Specifications for Artix-7 FPGAs. Revised specifications and added capacitor location figures for:</p> <ul style="list-style-type: none"> Figure 4-25: FB676, FBG676, and FBV676 Flip-Chip Lidless BGA Package Specifications for Kintex-7 FPGAs Figure 4-28: XC7K325T FB676, FBG676, and FBV676 Die Dimensions with Capacitor Locations Figure 4-29: XC7K410T FB676, FBG676, and FBV676 Die Dimensions with Capacitor Locations Figure 4-30: FB900, FBG900, and FBV900 Flip-Chip Lidless BGA Package Specifications for Kintex-7 FPGAs Figure 4-31: XC7K325T FB900, FBG900, and FBV900 Die Dimensions with Capacitor Locations Figure 4-32: XC7K410T FB900, FBG900, and FBV900 Die Dimensions with Capacitor Locations Figure 4-37: FF1156, FFG1156, and FFV1156 Flip-Chip BGA Package Specification for Kintex-7 FPGAs Figure 4-40: FF1157, FFG1157, FFV1157, FF1158, FFG1158, and FFV1158 Flip-Chip BGA Package Specification for Virtex-7 FPGAs <p>Added Thermal Management Strategy, Heat Sink Removal Procedure, and updated Soldering Guidelines in Chapter 5.</p> <p>Updated Table A-1.</p>

Date	Version	Revision
2/03/2012	1.5	<p>Updated Table 1-3 and Table 1-5 and added Table 1-6. Updated Table 1-7 and Table 1-9 and added Table 1-10. Revised Note 2 in Table 1-12. Removed Figures 1-1 and 1-2 along with references to the XC7A8, XC7A15, XC7A30T, and XC7A50T. Added Figure 1-10 and Figure 1-3. Clarified Figure 1-14 through Figure 1-17, Figure 1-19, Figure 1-23, and Figure 1-26.</p> <p>Updated Table 2-4 and added Table 2-5.</p> <p>Added devices to Table 3-2 and revised Table 3-3 (XC7K420T and XC7K480T). Updated Table 3-4 and added Table 3-5 and Table 3-5.</p> <p>Revised specifications in:</p> <ul style="list-style-type: none"> Figure 4-22: FB484, FBG484, and FBV484 (Kintex-7 FPGAs) Flip-Chip Lidless BGA (1.0 mm Pitch). Figure 4-25: FB676, FBG676, and FBV676 (Kintex-7 FPGAs) Flip-Chip Lidless BGA (1.0 mm Pitch). Figure 4-30: FB900, FBG900, and FBV900 (Kintex-7 FPGAs) Flip-Chip Lidless BGA (1.0 mm Pitch) and combined with Figure 4-6. Figure 4-40: FF1157, FFG1157, FFV1157, FF1158, FFG1158, and FFV1158 (Virtex-7 FPGAs) Flip-Chip BGA (1.0 mm Pitch). <p>Added thermal resistance data to Table 5-1 and added the Soldering Guidelines section.</p> <p>Added Appendix B.</p>
10/17/2011	1.4	<p>Revised the FBG484 and FBV484 Package section describing XC7K160T and XA7K160T Banks.</p> <p>Added the mechanical drawings: Figure 4-41 and Figure 4-45. Updated Figure 4-44 to include the FF(G)1928 package.</p> <p>Added thermal resistance data to Table 5-1.</p>
10/03/2011	1.3	<p>Added Artix-7 device information including updating Table 1-1, adding Table 1-3, Table 1-8, Table 2-2, and Table 3-2.</p> <p>Clarified the interposer in Figure-12 and Figure 1-19. Revised horizontal center for the XC7VX415T in Figure 1-21. Updated the DXP_0, DXN_0 description and notes in Table 1-12. Added devices to the Die Level Bank Numbering Overview section.</p> <p>Clarified the I/O banks summary section.</p> <p>Added Artix-7 device diagrams in the CSG324 package. Added XC7V585T device diagrams Figure 3-133 through Figure 3-140.</p> <p>Moved AD4P/N, AD12P/N, and AD5P/N pins from [IO_L2P_T0_35:IO_L4N_T0_35] to [IO_L1P_T0_35:IO_L3N_T0_35] in Figure 3-141, Figure 3-145, Figure 3-165, Figure 3-169, Figure 3-173, Figure 3-177, and Figure 3-181.</p> <p>Fixed the labeling for EMCCLK in Figure 3-125, Figure 3-133, Figure 3-141, Figure 3-145, Figure 3-165, Figure 3-169, Figure 3-173, Figure 3-177, and Figure 3-181.</p> <p>Updated the mechanical drawings for Figure 4-41 and Figure 4-44.</p> <p>Updated thermal resistance data in Table 5-1.</p> <p>Updated Chapter 6, Package Marking.</p>

Date	Version	Revision
6/14/2011	1.2	<p>Added Virtex-7 device information including updating Table 1-1, adding Table 1-3, Table 1-10, Table 2-4, and Table 3-4. In Table 1-12, updated Note 3, the Configuration Pins section, and the Analog to Digital Converter (XADC) Pins section.</p> <p>Updated Figure 3-99, Figure 3-100, Figure 3-103, Figure 3-104, Figure 3-107, Figure 3-108, Figure 3-111, Figure 3-112, Figure 3-115, Figure 3-116, Figure 3-119, and Figure 3-120. Added Figure 3-120 through Figure 3-184.</p> <p>Added Figure 4-37 the mechanical drawing for the Kintex-7 devices FFG1156 package. Also added some Virtex-7 device mechanical drawings in Figure 4-37 through Figure 4-44.</p> <p>Added thermal resistance data to Table 5-1.</p>
4/06/2011	1.1	<p>Removed the SBG324 package from the entire document. Added three Kintex®-7 devices: XC7K355T, XC7K420T, and XC7K480T.</p> <p>Updated disclaimer and copyright on page 343. Updated package size of FF1156 in Table 1-1. Updated DXP_0, DXN_0 in Table 1-12.</p> <p>The Table 2-3 single ASCII device files have been updated for both the XC7K70T and XC7K160T. All ASCII TXT files and the overall ZIP file have been updated on the web.</p> <p>Updated the XC7K70TFBG676 figures: Figure 3-101, Figure 3-102, Figure 3-103, and Figure 3-104.</p> <p>Added information to Chapter 4, Mechanical Drawings, Chapter 5, Thermal Specifications, and Chapter 6, Package Marking.</p>
3/01/2011	1.0	Initial Xilinx release.

Chapter 1: Packaging Overview

About this Guide	16
Introduction	16
Device/Package Combinations and Maximum I/Os	17
Serial Transceiver Channels by Device/Package	19
User I/O Pins by Device/Package	22
Pin Definitions	28
Pin Compatibility between Packages	33
Migrating between Devices	33
Die Level Bank Numbering Overview	34
Banking and Clocking Summary	34
XC7S6, XA7S6, XC7S15, and XA7S15 Banks	36
FTGB196 Package	36
CPGA196 Package	36
CSGA225 Package	36
XC7S25 and XA7S25 Banks	37
FTGB196 Package	37
CSGA225 Package	37
CSGA324 Package	37
XC7S50 and XA7S50 Banks	38
FTGB196 Package	38
CSGA324 Package	38
FGGA484 Package	38
XC7S75, XA7S75, XC7S100, and XA7S100 Banks	39
FGGA484 Package	39
FGGA676 Package	39
XC7A12T, XA7A12T, XC7A25T, and XA7A25T Banks	40
CPG238 Package	40
CSG325 Package	40
XC7A15T, XC7A35T, XA7A15T, and XA7A35T Banks	41
CPG236 Package	41
FTG256 Package (XC7A15T and XC7A35T only)	41
CSG324 Package	41
CSG325 Package	41
FGG484 Package (XC7A15T and XC7A35T only)	41
XC7A50T, XA7A50T, and XQ7A50T Banks	42
CPG236 Package	42
FTG256 Package (XC7A50T only)	42
CSG324 Package	42
CSG325 Package	42
FGG484 Package (XC7A50T and XQ7A50T only)	42
XC7A75T and XA7A75T Banks	43
FTG256 Package (XC7A75T only)	43

CSG324 Package	43
FGG484 Package	43
FFG676 Package (XC7A75T only)	43
XC7A100T, XQ7A100T, and XA7A100T Banks	44
FTG256 Package (XC7A100T only)	44
CSG324 Package	44
FGG484 Package	44
FFG676 Package (XC7A100T only)	44
XC7A200T and XQ7A200T Banks	45
SBG484, SBV484, and RS484 Packages	45
FBG484, FBV484, and RB484 Packages	45
FBG676, FBV676, and RB676 Packages	45
FFG1156 and FFV1156 Package (XC7A200T only)	45
XC7K70T Banks	46
FBG484 and FBV484 Package	46
FBG676 and FBV676 Package	46
XC7K160T and XA7K160T Banks	47
FBG484 and FBV484 Package	47
FBG676, FBV676, FFG676, FFV676, and RF676 Packages	47
XC7K325T and XQ7K325T Banks	48
FBG676, FBV676, FFG676, FFV676, and RF676 Packages	48
FBG900, FBV900, FFG900, FFV900, and RF900 Packages	48
XC7K355T Banks	49
FFG901 and FFV901 Package	49
XC7K410T and XQ7K410T Banks	50
FBG676, FBV676, FFG676, FFV676, and RF676 Packages	50
FBG900, FBV900, FFG900, FFV900, and RF900 Packages	50
XC7K420T Banks	51
FFG901 and FFV901 Package	51
FFG1156 and FFV1156 Package	51
XC7K480T Banks	52
FFG901 and FFV901 Package	52
FFG1156 and FFV1156 Package	52
XC7V585T and XQ7V585T Banks	53
FFG1157 and RF1157 Packages	53
FFG1761 and RF1761 Packages	53
XC7V2000T Banks	54
FHG1761 Package	54
FLG1925 Package	54
XC7VX330T and XQ7VX330T Banks	56
FFG1157, FFV1157, and RF1157 Packages	56
FFG1761, FFV1761, and RF1761 Packages	56

Chapter 3 Device Diagrams

Summary	73
Spartan-7 FPGAs Device Diagrams	74
CPGA196 Package—XC7S6, XA7S6, XC7S15, and XA7S15	75
FTGB196 Package—XC7S6 and XC7S15	77
FTGB196 Package—XC7S25 and XC7S50	79
CSGA225 Package—XC7S6, XC7S15, XA7S6, and XA7S15	81
CSGA225 Package—XC7S25 and XA7S25	83
CSGA324 Package—XC7S25 and XA7S25	85
CSGA324 Package—XC7S50 and XA7S50	87
FGGA484 Package—XC7S50 and XA7S50	89
FGGA484 Package—XC7S75, XC7S100, XA7S75, and XA7S100	91
FGGA676 Package—XC7S75, XC7S100, XA7S75, and XA7S100	94
Artix-7 FPGAs Device Diagrams	97
CP236 and CPG236 Packages—XC7A15T, XC7A35T, and XC7A50T	
CPG236 Package (only)—XA7A15T, XA7A35T, and XA7A50T	98
CPG238 Package—XC7A12T, XC7A25T, XA7A12T, and XA7A25T	100
CS324 and CSG324 Packages—XC7A15T, XC7A35T, XC7A50T, XC7A75T, and XC7A100T	
CS324 Packages (only)—XA7A15T, XA7A35T, XA7A50T, XA7A75T, and XA7A100T	102

Chapter 4: Mechanical Drawings

Summary.....	258
Spartan-7 FPGAs	258
Artix-7 FPGAs	258
Kintex-7 FPGAs	259
Virtex-7 FPGAs	260
CGPA196 (Spartan-7 FPGAs)	
Wire-Bond Chip-Scale BGA (0.5 mm Pitch)	261
FTGB196 (Spartan-7 FPGAs)	
Wire-Bond Chip-Scale BGA (1.0mm Pitch)	262
CSGA225 (Spartan-7 FPGAs)	
Wire-Bond Chip-Scale BGA (0.8mm Pitch)	263
CSGA324 (Spartan-7 FPGAs)	
Wire-Bond Chip-Scale BGA (0.8mm Pitch)	264
FGGA484 (Spartan-7 FPGAs) Wire-Bond Fine-Pitch BGA (1.0mm Pitch).....	265
FGGA676 (Spartan-7 FPGAs) Wire-Bond Fine-Pitch BGA (1.0mm Pitch).....	266

CP236 and CPG236 (Artix-7 FPGAs)	
Wire-Bond Chip-Scale BGA (0.5 mm Pitch)	267
CPG238 (Artix-7 FPGAs: XC7A12T and XC7A25T)	
Wire-Bond Chip-Scale BGA (0.5 mm Pitch)	268
CS/CSG324 and CS/CSG325 (Artix-7 FPGAs)	
Wire-Bond Chip-Scale BGA (0.8 mm Pitch)	269
FT/FTG256 (Artix-7 FPGAs) Wire-Bond Fine-Pitch Thin BGA (1.0mm Pitch)	270
SB484, SBG484, and SBV484 (Artix-7 FPGAs)	
Flip-Chip Lidless BGA (0.8mm Pitch)	271
FB484, FBG484, and FBV484 (Artix-7 FPGAs)	
Flip-Chip Lidless BGA (1.0mm Pitch)	272
FB676, FBG676, and FBV676 (Artix-7 FPGAs)	
Flip-Chip Lidless BGA (1.0mm Pitch)	274
FG484 and FGG484 (Artix-7 FPGAs) Wire-Bond Fine-Pitch BGA (1.0mm Pitch)	276
FG676 and FGG676 (Artix-7 FPGAs) Wire-Bond Fine-Pitch BGA (1.0mm Pitch)	277
FF1156, FFG1156, and FFV1156 (Artix-7 FPGAs)	
Flip-Chip BGA (1.0mm Pitch)	278
RB484 (Artix-7 FPGAs) Ruggedized Flip-Chip BGA (1.0mm Pitch)	279
RS484 (Artix-7 FPGAs) Ruggedized Flip-Chip BGA (0.8mm Pitch)	280
RB676 (Artix-7 FPGAs) Ruggedized Flip-Chip BGA (1.0mm Pitch)	281
FB484, FBG484, and FBV484 (Kintex-7 FPGAs)	
Flip-Chip Lidless BGA (1.0mm Pitch)	282
FB676, FBG676, and FBV676 (Kintex-7 FPGAs)	
Flip-Chip Lidless BGA (1.0mm Pitch)	285
FB900, FBG900, and FBV900 (Kintex-7 FPGAs)	
Flip-Chip Lidless BGA (1.0mm Pitch)	290
FF676, FFG676, and FFV676 (Kintex-7 FPGAs)	
Flip-Chip BGA (1.0mm Pitch)	293
FF900 and FFG900 (XC7K325T and XC7K410T) Flip-Chip BGA (1.0mm Pitch) with Stamped Lid.	294
FF900, FFG900, FFV900, FF901, FFG901, and FFV901 (Kintex-7 FPGAs) Flip-Chip BGA (1.0mm Pitch)	295
FF1156 and FFG1156 (XC7K420T and XC7K480T) Flip-Chip BGA (1.0mm Pitch) with Stamped Lid.	296
FF1156, FFG1156, and FFV1156 (Kintex-7 FPGAs)	
Flip-Chip BGA (1.0mm Pitch)	297
RF676 (Kintex-7 FPGAs) Flip-Chip BGA (1.0mm Pitch)	298
RF900 (Kintex-7 FPGAs) Flip-Chip BGA (1.0mm Pitch)	299
FF1157, FFG1157, FFV1157, FF1158, FFG1158, and FFV1158 (Virtex-7 FPGAs)	
Flip-Chip BGA (1.0mm Pitch)	300

FF1761 and FFG1761 (Virtex-7 FPGAs) Flip-Chip BGA (1.0mm Pitch)	301
FFV1761 (Virtex-7 FPGAs) Flip-Chip BGA (1.0mm Pitch)	302
FH1761 and FHG1761 (Virtex-7 T FPGAs) Flip-Chip BGA (1.0mm Pitch)	303
FF1926, FFG1926, FF1927, FFG1927, FFV1927, FF1928, FFG1928, FF1930, and FFG1930 (Virtex-7 XT FPGAs) Flip-Chip BGA (1.0mm Pitch)	304
FL1925, FLG1925, FL1926, FLG1926, FL1928, FLG1928, and FL1930, FLG1930 (Virtex-7 FPGAs) Flip-Chip BGA (1.0mm Pitch)	305
RF1157 and RF1158 Flip-Chip BGA (Virtex-7 FPGAs) (1.0mm Pitch)	306
RF1761 Flip-Chip BGA (Virtex-7 FPGAs) (1.0mm Pitch)	307
RF1930 Flip-Chip BGA (Virtex-7 FPGAs) (1.0mm Pitch)	308

Chapter 5: Thermal Specifications

Introduction	309
Thermal Resistance Data	309
Support for Thermal Models	315
Thermal Management Strategy	316
Cavity-Up Plastic BGA Packages	316
Wire-Bond Packages	316
Flip-Chip Packages	317
System Level Heat Sink Solutions	318
Thermal Interface Material	318
Types of TIM	319
Guidelines for Thermal Interface Materials	319
Thermal Conductivity of the Material	319
Electrical Conductivity of the Material	320
Spreading Characteristics of the Material	320
Long-Term Stability and Reliability of the Material	320
Ease of Application	320
Applied Pressure from Heat Sink to the Package via Thermal Interface Materials	320
Heat Sink Removal Procedure	321
Soldering Guidelines	322
Sn/Pb Reflow Soldering	323
Pb-Free Reflow Soldering	323
Post Reflow/Cleaning/Washing	327
Conformal Coating	327

Packaging Overview

About this Guide

Xilinx® 7 series FPGAs include four FPGA families that are all designed for lowest power to enable a common design to scale across families for optimal power, performance, and cost. The Spartan®-7 family is the lowest density with the lowest cost entry point into the 7 series portfolio. The Artix®-7 family is optimized for highest performance-per-watt and bandwidth-per-watt for cost-sensitive, high-volume applications. The Kintex®-7 family is an innovative class of FPGAs optimized for the best price-performance. The Virtex®-7 family is optimized for highest system performance and capacity.

This 7 series packaging and pinout product specification, part of an overall set of documentation on the 7 series FPGAs, is available on the Xilinx website at www.xilinx.com/documentation.

Introduction

This section describes the pinouts for the 7 series FPGAs in various fine pitch and flip-chip 1.0 mm pitch BGA packages, 0.8 mm and 0.5 mm pitch chip-scale packages, and 0.5 mm pitch wire-bond lead frame packages.

Spartan-7, Artix-7, and Kintex-7 devices are offered in low-cost, space-saving packages that are optimally designed for the maximum number of user I/Os.

Virtex-7 T and Virtex-7 XT devices are offered exclusively in high performance flip-chip BGA packages that are optimally designed for improved signal integrity and jitter.

For pinout and packaging information on the Virtex-7 HT devices, see www.xilinx.com/member/gtz/index.htm.

Package inductance is minimized as a result of optimal placement and even distribution as well as an increased number of Power and GND pins.

The FFG, FLG, FHG, FBG, SBG, and RFG flip-chip packages marked with the **Pb-free Character** on the upper right of the device are RoHS 6 of 6 compliant. The FFG, FLG, FHG, FBG, SBG, and RFG flip-chip packages not marked with the Pb-free character are RoHS 6 of 6 compliant,

with exemption 15 where there is lead in the C4 bumps that are used to complete a viable electrical connection between the semiconductor die and the package substrate. The FFV, FBV, and SBV flip-chip packages marked with the Pb-free character are RoHS 6 of 6 compliant (without the use of exemption 15). The CPG, CSG, FTG, and FGG non-flip chip packages are RoHS 6 of 6 compliant.

All of the 7 series devices supported in a particular package are pinout compatible. See [Pin Compatibility between Packages, page 33](#). Pins that are available in a device but are not available in a smaller device with a compatible package are listed as .

Each device is split into I/O banks to allow for flexibility in the choice of I/O standards (see the [UG471](#)). [Table 1-12](#) provides definitions for all pin types.

7 series device's flip-chip assembly materials are manufactured using ultra-low alpha (ULA) materials defined as <0.002 cph/cm² or materials that emit less than 0.002 alpha-particles per square centimeter per hour.

Device/Package Combinations and Maximum I/Os

[Table 1-1](#) shows the maximum number of user I/Os possible in the 7 series FPGAs BGA packages.

Table 1-1: 7 Series FPGAs Package Specifications

Packages ⁽¹⁾	Description	Package Specifications			
		Package Type	Pitch (mm)	Size (mm)	Maximum I/Os ⁽²⁾
CPGA196	Wire-bond chip-scale	BGA	0.5	8 x 8	100
FTB196/FTGB196		BGA	1.0	15 x 15	100
CP236/CPG236		BGA	0.5	10 x 10	106
CPG238		BGA	0.5	10 x 10	110
CSA225/CSGA225		BGA	0.8	13 x 13	100
CS324/CSG324		BGA	0.8	15 x 15	210
CSGA324		BGA	0.8	15 x 15	210
CS325/CSG325		BGA	0.8	15 x 15	150
FT256/FTG256	Wire-bond fine-pitch	BGA	1.0	17 x 17	170
FG484/FGG484		BGA	1.0	23 x 23	285
FGGA484		BGA	1.0	23 x 23	338
FG676/FGG676		BGA	1.0	27 x 27	300
FGGA676		BGA	1.0	27 x 27	400

Table 1-1: 7 Series FPGAs Package Specifications (Cont'd)

Packages ⁽¹⁾	Description	Package Specifications			
		Package Type	Pitch (mm)	Size (mm)	Maximum I/Os ⁽²⁾
SB484/SBG484/SBV484	Flip-chip lidless	BGA	0.8	19 x 19	285
FB484/FBG484/FBV484		BGA	1.0	23 x 23	285
RS484	Ruggedized flip-chip	BGA	0.8	19 x 19	285

Pin Definitions

Table 1-12 lists the pin definitions used in 7 series FPGAs packages.

Note: There are dedicated general purpose user I/O pins listed separately in [Table 1-12](#). There are also multi-function pins where the pin names start with either IO_LXXY_ZZZ_# or IO_XX_ZZZ_#, where ZZZ represents one or more functions in addition to being general purpose user I/O. If not used for their special function, these pins can be user I/O.

IMPORTANT:

Table 1-12: 7 Series FPGAs Pin Definitions

Pin Name	Type	Direction	Description
User I/O Pins			
IO_LXXY_# IO_XX_#	Dedicated	Input/ Output	<p>Most user I/O pins are capable of differential signaling and can be implemented as pairs. The top and bottom I/O pins are always single ended. Each user I/O is labeled IO_LXXY_#, where:</p> <ul style="list-style-type: none"> ◦ IO indicates a user I/O pin ◦ L indicates a differential pair, with XX a unique pair in the bank and Y = [P N] for the positive/negative sides of the differential pair ◦ # indicates a bank number
Configuration Pins			
For more information, see the			table in UG470 ,
CCLK_0	Dedicated ⁽¹⁾	Input/ Output	Configuration clock. Output in Master mode or input in Slave mode
DONE_0	Dedicated ⁽¹⁾	Bidirectional	DONE indicates successful completion of configuration (active High)
INIT_B_0	Dedicated ⁽¹⁾	Bidirectional (open-drain)	Indicates initialization of configuration memory (active Low)
M0_0, M1_0, or M2_0	Dedicated ⁽¹⁾	Input	Configuration mode selection
PROGRAM_B_0	Dedicated ⁽¹⁾	Input	Asynchronous reset to configuration logic (active Low)
TCK_0	Dedicated ⁽¹⁾	Input	JTAG clock
TDI_0	Dedicated ⁽¹⁾	Input	JTAG data input
TDO_0	Dedicated ⁽¹⁾	Output	JTAG data output
TMS_0	Dedicated ⁽¹⁾	Input	JTAG mode select

This pin selects the preconfiguration I/O standard type for the dedicated and multi-function configuration banks

CFGBVS_0 Dedicated⁽¹⁾ Input

Table 1-12: 7 Series FPGAs Pin Definitions (*Cont'd*)

Pin Name	Type	Direction	Description
Power/Ground Pins			
GND	Dedicated	N/A	Ground
RSVDGND	Dedicated	N/A	Reserved pins, tie to GND
VCCAUX	Dedicated	N/A	1.8V power-supply pins for auxiliary circuits
VCCAUX_IO_G# ⁽²⁾	Dedicated	N/A	1.8V/2.0V power-supply pins for auxiliary I/O circuits
VCCINT	Dedicated	N/A	0.9V/1.0V power-supply pins for the internal core logic
VCCO_# ⁽³⁾	Dedicated	N/A	Power-supply pins for the output drivers (per bank)
VCCBRAM	Dedicated	N/A	1.0V power-supply pins for the FPGA logic block RAM
VCCBATT_0	Dedicated	N/A	Decryptor key memory backup supply; this pin should be tied to the appropriate V _{CC} or GND when not used ⁽⁴⁾ . Specific Spartan-7 devices (XC7S6 and XC7S15) do not support AES encryption. In these devices, connect VCCBATT_0 to VCCAUX or GND.
VREF	Multi-function	N/A	These are input threshold voltage pins. They become user I/Os when an external threshold voltage is not needed (per bank).
Analog to Digital Converter (XADC) Pins			
For more information, see the table in UG480 ,			
VCCADC_0 ⁽⁵⁾⁽⁶⁾	Dedicated	N/A	XADC analog positive supply voltage The XC7S6 and XC7S15 Spartan-7 devices do not support the XADC. In these devices, connect the VCCADC_0 pin to VCCAUX.
GNDADC_0 ⁽⁵⁾⁽⁶⁾	Dedicated	N/A	XADC analog ground reference The XC7S6 and XC7S15 Spartan-7 devices do not support the XADC. In these devices, connect the GNDADC_0 pin to GND.
VP_0 ⁽⁵⁾	Dedicated	Input	XADC dedicated differential analog input (positive side)
VN_0 ⁽⁵⁾	Dedicated	Input	XADC dedicated differential analog input (negative side)
VREFP_0 ⁽⁵⁾	Dedicated	N/A	1.25V reference input
VREFN_0 ⁽⁵⁾	Dedicated	N/A	1.25V reference GND reference
AD0P through AD15P AD0N through AD15N	Multi-function	Input	XADC (analog-to-digital converter) differential auxiliary analog inputs 0–15. Auxiliary channels 6, 7, 13, 14, and 15 are not supported on Kintex-7 devices.

Other Pins

MRCC	Multi-function
------	----------------

SRCC Multi-function Input

These are the clock capable I/Os driving BUFRs, BUFIOS, BUFGs, and MMCMs/PLLs. These pins become regular user I/Os when not needed for clocks. When connecting a single-ended clock to the differential CC pair of pins, it must be connected to the positive (P) side of the pair. The SRCC (single region) pins can drive four BUFIOS and four BUFRs in a single bank.

VRN

Pin Compatibility between Packages

7 series FPGA devices are pin compatible only with other 7 series FPGA devices of the same family (Spartan-7, Artix-7, Kintex-7, and Virtex-7) in the same package. In addition, FB/FBG/ FBV, FF/FFG/FFV, FH/FHG, FL/FLG, RB, RF, and RS packages of the same pin-count designator are pin compatible. Also, in Artix-7 devices the FGG and FBG packages are pin compatible.

Note: Pin compatible packages can have substantially different decoupling capacitor recommendations.

Some FB/FBG and RB packages include V_{CCAUX_IO} pins that are not utilized by the I/O. These pins are placeholders to ensure pin compatibility with FF/FFG/FFV and RF packages. In the FF/FFG/FFV and RF packages, when the high-performance option is chosen for the HP I/O banks, the V_{CCAUX_IO} pins must be connected to a separate power supply from V_{CCAUX} . Therefore, to allow for migration to the FF/FFG/FFV and RF packages, V_{CCAUX_IO} must be connected to the appropriate voltage/regulator.

Migrating between Devices

When migrating between devices using the same package, any differences between the devices must be taken into consideration. Examples include the following.

- Package pins that are routed from a specific bank in one device can be routed from a different bank in another device. Migration between the two devices can be affected when interfaces span multiple banks.
- Package pins routed to pins of a certain pin type in one device can be routed to a different pin type in another device. Migration differences can include clock-capable pins or differential signal capable pins in the first device with non-clock capable pins or single-ended pins in the second device.
- Package pins routed from a single bank on one device can be routed from multiple banks on another device. To prevent multiple voltage levels between the devices, the V_{CCO} voltage level of the multiple banks on the second device must be the same as the voltage level of the single bank on the first device.
- The auxiliary analog input pins AD[15:00] for the XADC in some devices are not always routed to the same pins in other devices. Each device can have available a different number of auxiliary analog input pins. Prior to designing with XADCs, the compatibility between pins in each device should be thoroughly analyzed.

Die Level Bank Numbering Overview

Banking and Clocking Summary

- The center clocking backbone contains all vertical clock tracks and clock buffer connectivity.
- The CMT backbone contains all vertical CMT connectivity and is located in the CMT column.
- Not all banks are bonded out in every part/package combination.
- GTP/GTX/GTH columns summary
 - One GT Quad = Four transceivers = Four GTPE2 or GTXE2 or GTHE2 primitives.
 - Not all GT Quads are bonded out in every package.
- I/O banks summary
 - Each bank has four pairs of clock capable (CC) inputs for four differential or four single ended clock inputs.
 - Can connect to the CMT in the same region and the region above and below (with restrictions).
 - Two MRCC pairs can connect to the BUFRs and BUFIos in the same region/banks and the regions/banks above and below.
 - Two SRCC pairs can only connect to the BUFRs and BUFIos in the same region/bank.
 - There are no global clock pins (GC pins) in the 7 series FPGAs.
 - Each user I/O bank has 50 single-ended I/Os or 24 differential pairs (48 differential I/Os). The top and bottom I/O pin are always single ended. All 50 pads of a bank are not always bonded out to pins.
- Bank locations of dedicated and dual-purpose pins
 - In most devices, banks 14 and 15 always contain the dual-purpose configuration pins. Bank 15 and 35 contains the XADC auxiliary inputs; however, in Kintex-7 devices, the auxiliary inputs are only in bank 15. Bank 0 contains the dedicated configuration pins.
 - All dedicated configuration I/Os (bank 0) are 3.3V capable.
 - The multi-function configuration banks 14 and 15 are restricted during configuration. The SSI technology devices (XC7VX1140T and XC7V2000T) pins in banks 11, 12, 17, 18, 20, and 21 are restricted, similar to multi-function pins. Pins in these banks do not have configuration functions. Because there are architectural differences between these and other banks, special consideration must be taken. For more information, see the [Xilinx Configuration Reference Guide](#) and the [Xilinx Configuration Application Note](#).

sections of [UG471](#),

- The physical XY locations for each IDELAYCTRL start at X0Y0 in the bottom left-most bank. The locations then increment by one starting with the lowest bank number in each column in the vertical Y direction and by one for each column in the horizontal X direction. IDELAYCTRLs are located in each of the HROWS.

This section visually describes the die level bank numbering.

- Virtex-7 XT devices (XC7VX330T, XC7VX415T, XC7VX485T, XC7VX550T, XC7VX690T, XC7VX980T, and XC7VX1140T) on [page 56](#) through [page 66](#).

XC7S6, XA7S6, XC7S15, and XA7S15 Banks

Figure 1-1 shows the I/O and transceiver banks.

FTGB196 Package

All HR I/O banks are fully bonded out in this package.

CPGA196 Package

All HR I/O banks are fully bonded out in this package.

CSGA225 Package

All HR I/O banks are fully bonded out in this package.

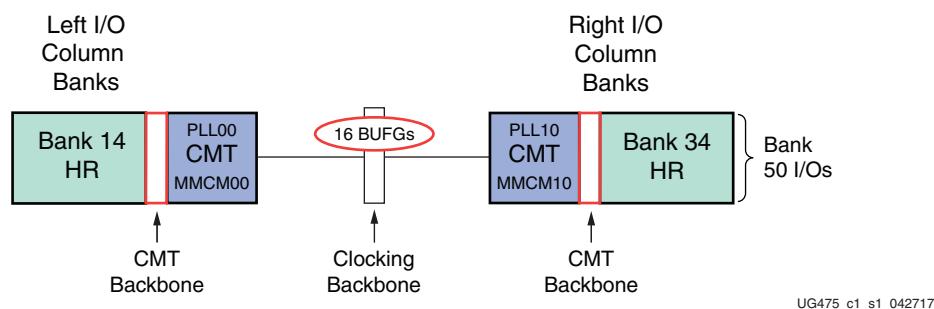

Figure 1-1: XC7S6, XA7S6, XC7S15, and XA7S15 Banks

XC7S25 and XA7S25 Banks

Figure 1-2 shows the I/O and transceiver banks.

FTGB196 Package

HR I/O bank 15 is not bonded out.

CSGA225 Package

All HR I/O banks are fully bonded out in this package.

CSGA324 Package

All HR I/O banks are fully bonded out in this package.

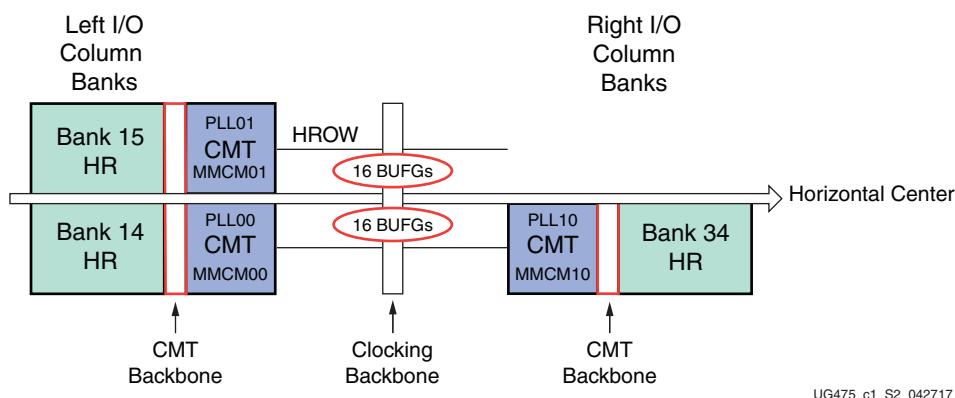

Figure 1-2: XC7S25 and XA7S25 Banks

XC7S50 and XA7S50 Banks

Figure 1-3 shows the I/O and transceiver banks.

FTGB196 Package

HR I/O banks 15, 16, and 35 are not bonded out.

CSGA324 Package

HR I/O bank 16 is partially bonded out.

FGGA484 Package

All HR I/O banks are fully bonded out in this package.

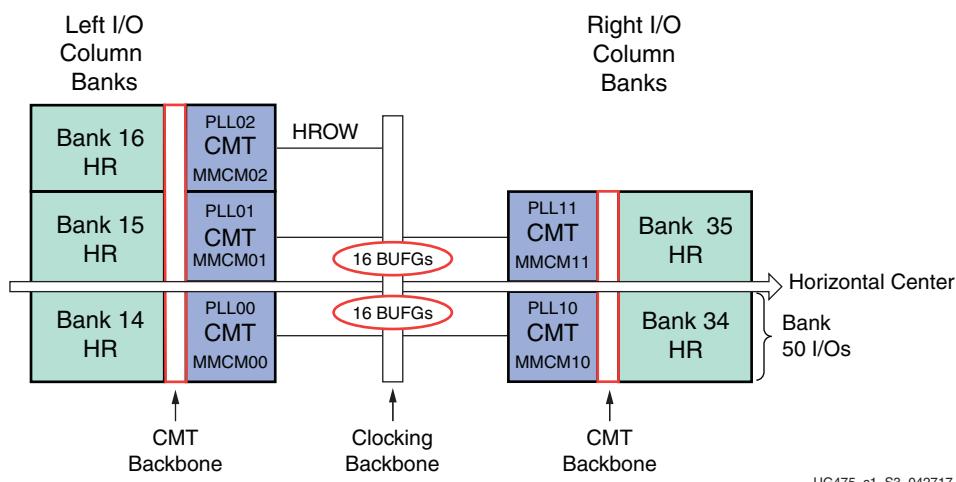

Figure 1-3: XC7S50 and XA7S50 Banks

XC7S75, XA7S75, XC7S100, and XA7S100 Banks

Figure 1-4 shows the I/O and transceiver banks.

FPGA484 Package

- HR I/O bank 13 is partially bonded out.
- HR I/O bank 33 is not bonded out.

FPGA676 Package

All HR I/O banks are fully bonded out in this package.

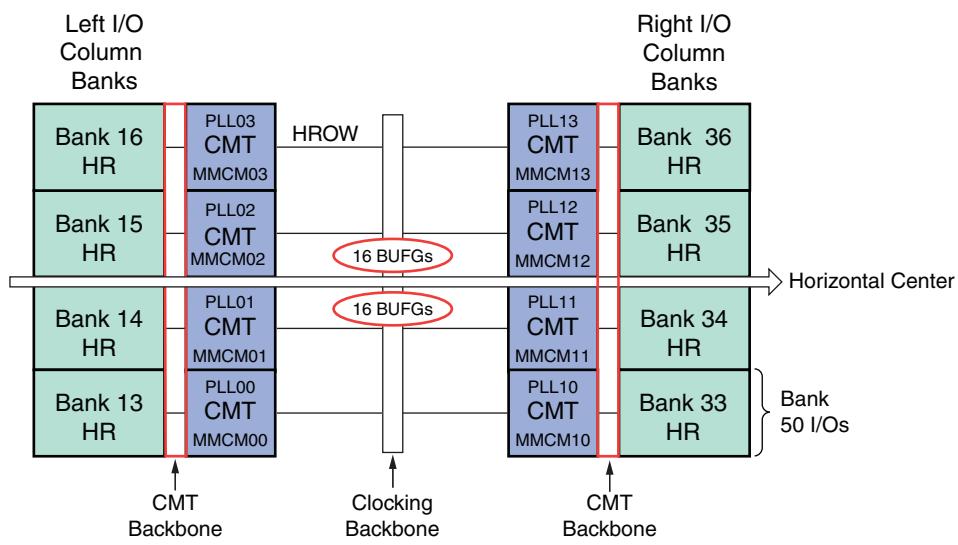

Figure 1-4: XC7S75, XA7A75T, XC7S100, and XA7S100 Banks

XC7A12T, XA7A12T, XC7A25T, and XA7A25T Banks

Figure 1-5 shows the I/O and transceiver banks.

CPG238 Package

- HR I/O banks 15 and 34 are partially bonded out.
- The GTP Quad 215 is partially bonded out.

CSG325 Package

- All HR I/O banks are fully bonded out in this package.
- The GTP Quad 215 is partially bonded out for the XC7A12T and XA7A12T. All GTP Quads are fully bonded out for the XC7A25T and XA7A25T.

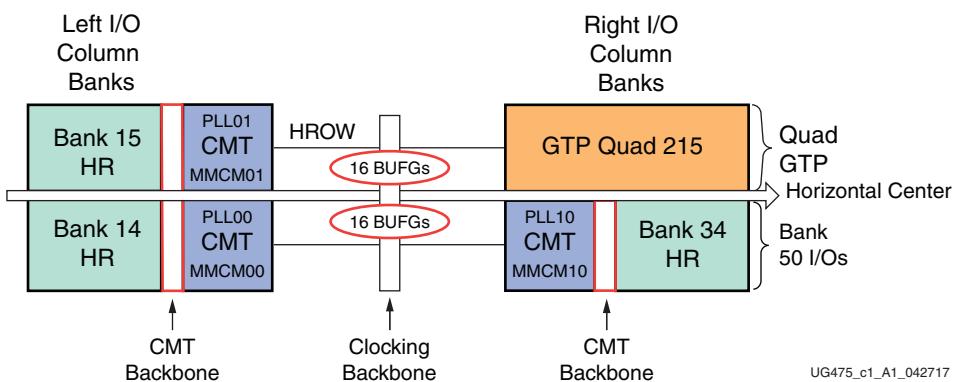

Figure 1-5: XC7A12T, XA7A12T, XC7A25T, and XA7A25T Banks

XC7A15T, XC7A35T, XA7A15T, and XA7A35T Banks

Figure 1-6 shows the I/O and transceiver banks.

CPG236 Package

- HR I/O bank 15 is not bonded out.
- HR I/O banks 16, 34, and 35 are partially bonded out.
- The GTP Quad 216 is partially bonded out.

FTG256 Package (XC7A15T and XC7A35T only)

- HR I/O bank 16 is not bonded out.
- HR I/O bank 34 is partially bonded out.
- The GTP Quad 216 is not bonded out.

CSG324 Package

- HR I/O bank 16 is partially bonded out.
- The GTP Quad 216 is not bonded out.

CSG325 Package

- HR I/O banks 16 and 35 are not bonded out.
- All GTP Quads are fully bonded out in this package.

FGG484 Package (XC7A15T and XC7A35T only)

All HR I/O banks and the GTP Quads are fully bonded out in this package.

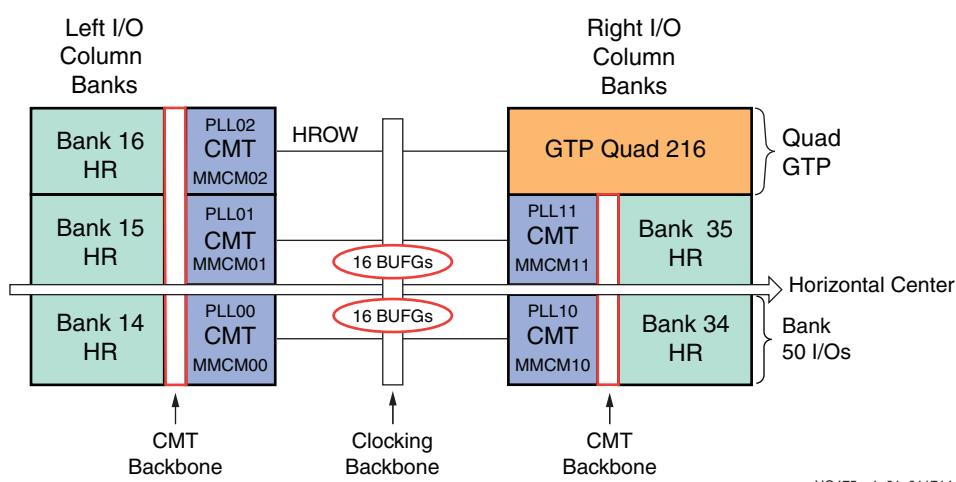

Figure 1-6: XC7A15T, XC7A35T, XA7A15T, and XA7A35T Banks

XC7A50T, XA7A50T, and XQ7A50T Banks

Figure 1-7 shows the I/O and transceiver banks.

CPG236 Package

- HR I/O bank 15 is not bonded out.
- HR I/O banks 16, 34, and 35 are partially bonded out.

FTG256 Package (XC7A50T only)

- HR I/O bank 16 is not bonded out.
- HR I/O bank 34 is partially bonded out.
- The GTP Quad 216 is not bonded out.

CSG324 Package

- HR I/O bank 16 is partially bonded out.
- The GTP Quad 216 is not bonded out.

CSG325 Package

- HR I/O banks 16 and 35 are not bonded out.
- All GTP Quads are fully bonded out in this package.

FGG484 Package (XC7A50T and XQ7A50T only)

All HR I/O banks and the GTP Quads are fully bonded out in this package.

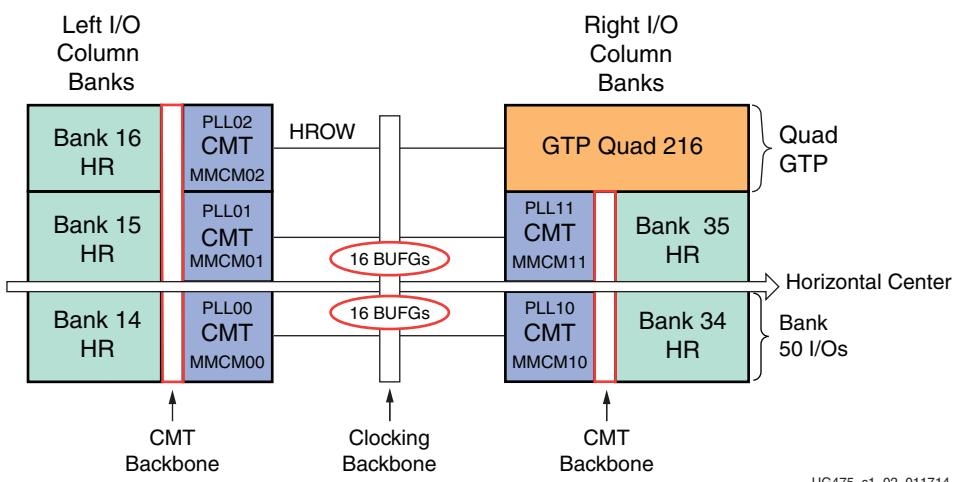

Figure 1-7: XC7A50T, XA7A50T, and XQ7A50T Banks

XC7A75T and XA7A75T Banks

Figure 1-8 shows the I/O and transceiver banks.

FTG256 Package (XC7A75T only)

- HR I/O banks 13 and 16 are not bonded out.
- HR I/O bank 34 is partially bonded out.
- The GTP Quads 213 and 216 are not bonded out.

CSG324 Package

- HR I/O bank 13 is not bonded out.
- HR I/O bank 16 is partially bonded out.
- The GTP Quads 213 and 216 are not bonded out.

FGG484 Package

- HR I/O bank 13 is partially bonded out.
- The GTP Quad 213 is not bonded out.

FGG676 Package (XC7A75T only)

All HR I/O banks and the GTP Quads are fully bonded out in this package.

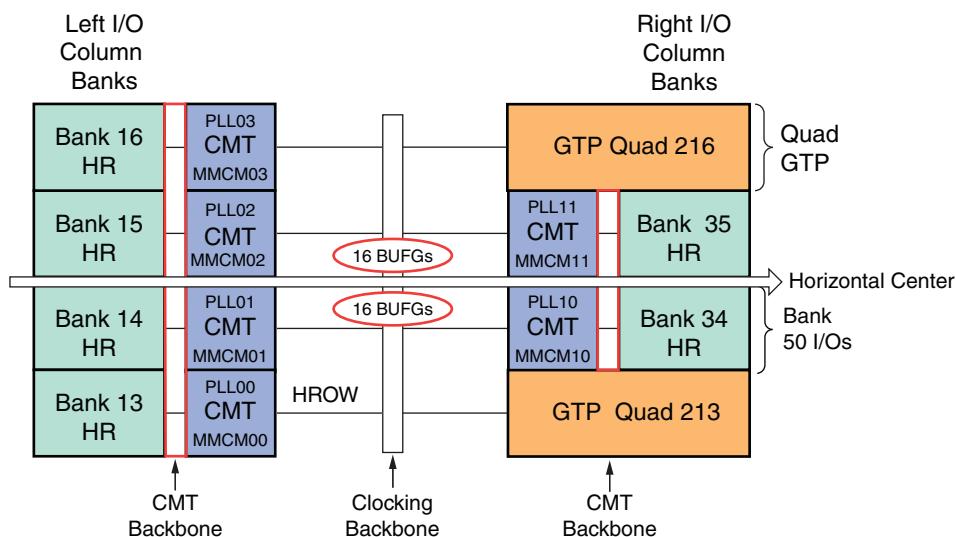

Figure 1-8: XC7A75T and XA7A75T Banks

XC7A100T, XQ7A100T, and XA7A100T Banks

Figure 1-9 shows the I/O and transceiver banks.

FTG256 Package (XC7A100T only)

- HR I/O banks 13 and 16 are not bonded out.
- HR I/O bank 34 is partially bonded out.
- The GTP Quads 213 and 216 are not bonded out.

CSG324 Package

- HR I/O bank 13 is not bonded out.
- HR I/O bank 16 is partially bonded out.
- The GTP Quads 213 and 216 are not bonded out.

FGG484 Package

- HR I/O bank 13 is partially bonded out.
- The GTP Quad 213 is not bonded out.

FGG676 Package (XC7A100T only)

All HR I/O banks and the GTP Quads are fully bonded out in this package.

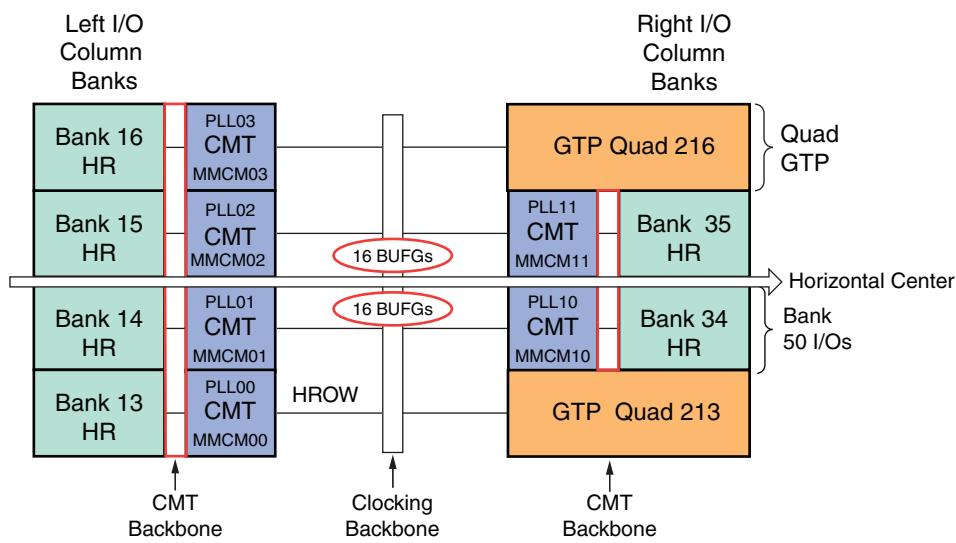

Figure 1-9: XC7A100T, XQ7A100T, and XA7A100T Banks

XC7A200T and XQ7A200T Banks

Figure 1-10 shows the I/O and transceiver banks.

SBG484, SBV484, and RS484 Packages

- HR I/O bank 13 is partially bonded out.
- HR I/O banks 12, 32, 33, and 36 are not bonded out.
- The GTP Quads 113, 116, and 213 are not bonded out.

FBG484, FBV484, and RB484 Packages

- HR I/O bank 13 is partially bonded out.
- HR I/O banks 12, 32, 33, and 36 are not bonded out.
- The GTP Quads 113, 116, and 213 are not bonded out.

FBG676, FBV676, and RB676 Packages

- HR I/O banks 32 and 36 are not bonded out.
- The GTP Quads 113 and 116 are not bonded out.

FFG1156 and FFV1156 Package (XC7A200T only)

All HR I/O banks and the GTP Quads are fully bonded out in this package.

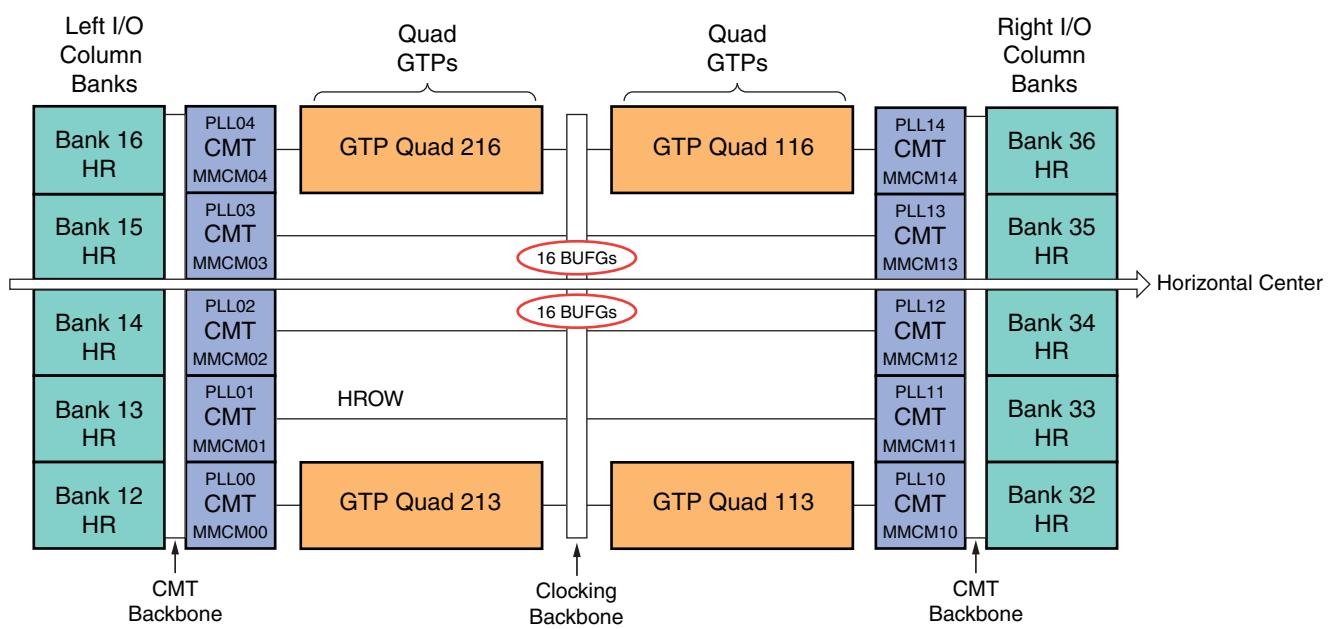

Figure 1-10: XC7A200T and XQ7A200T Banks

XC7K70T Banks

Figure 1-11 shows the I/O and transceiver banks for the XC7K70T.

FBG484 and FBV484 Package

- HR I/O bank 16 is partially bonded out.
- All HP I/O banks are fully bonded out.
- The GTX Quad 116 is not bonded out.

FBG676 and FBV676 Package

All HR and HP I/O banks and the GTX Quads are fully bonded out in this package.

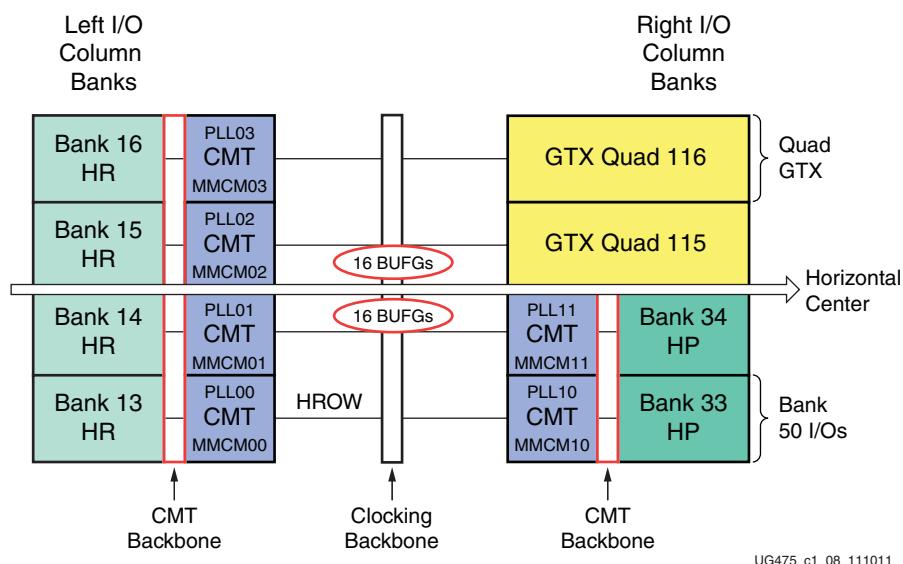

Figure 1-11: XC7K70T Banks

XC7K160T and XA7K160T Banks

Figure 1-12 shows the I/O and transceiver banks for the XC7K160T and XA7K160T.

FBG484 and FBV484 Package

- HR I/O bank 12 is not bonded out and bank 16 is partially bonded out.
- HP I/O bank 32 is not bonded out.
- The GTX Quad 116 is not bonded out.

FBG676, FBV676, FFG676, and FFV676 Packages

All HR and HP I/O banks and the GTX Quads are fully bonded out in these packages.

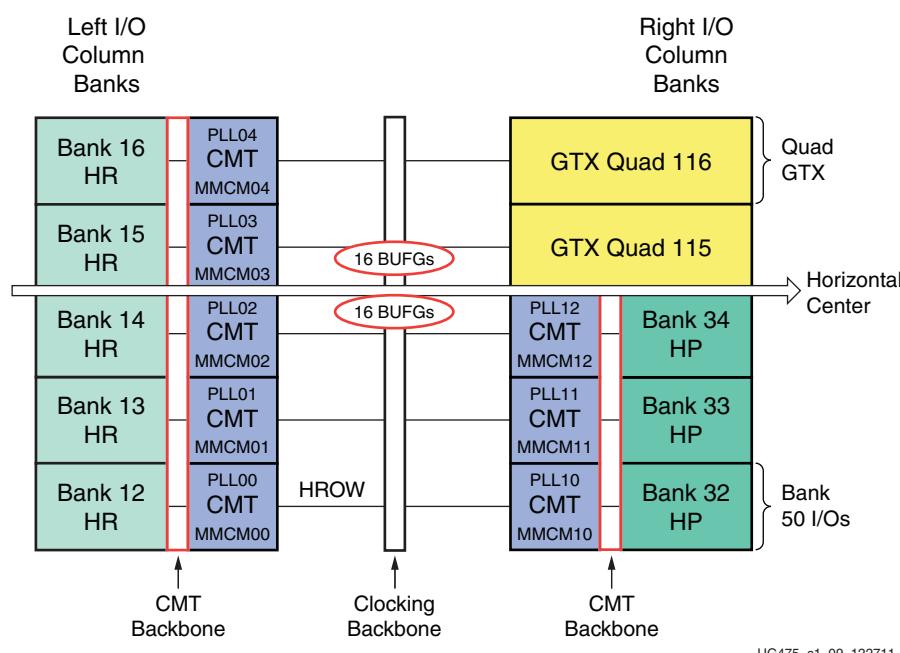

Figure 1-12: XC7K160T and XA7K160T Banks

XC7K325T and XQ7K325T Banks

Figure 1-13 shows the I/O and transceiver banks for the XC7K325T and XQ7K325T.

FBG676, FBV676, FFG676, FFV676, and RF676 Packages

- HR I/O banks 17 and 18 are not bonded out.
- All HP I/O banks are fully bonded out.
- GTX Quads 117 and 118 are not bonded out.

FBG900, FBV900, FFG900, FFV900, and RF900 Packages

All HR and HP I/O banks and the GTX Quads are fully bonded out in these packages.

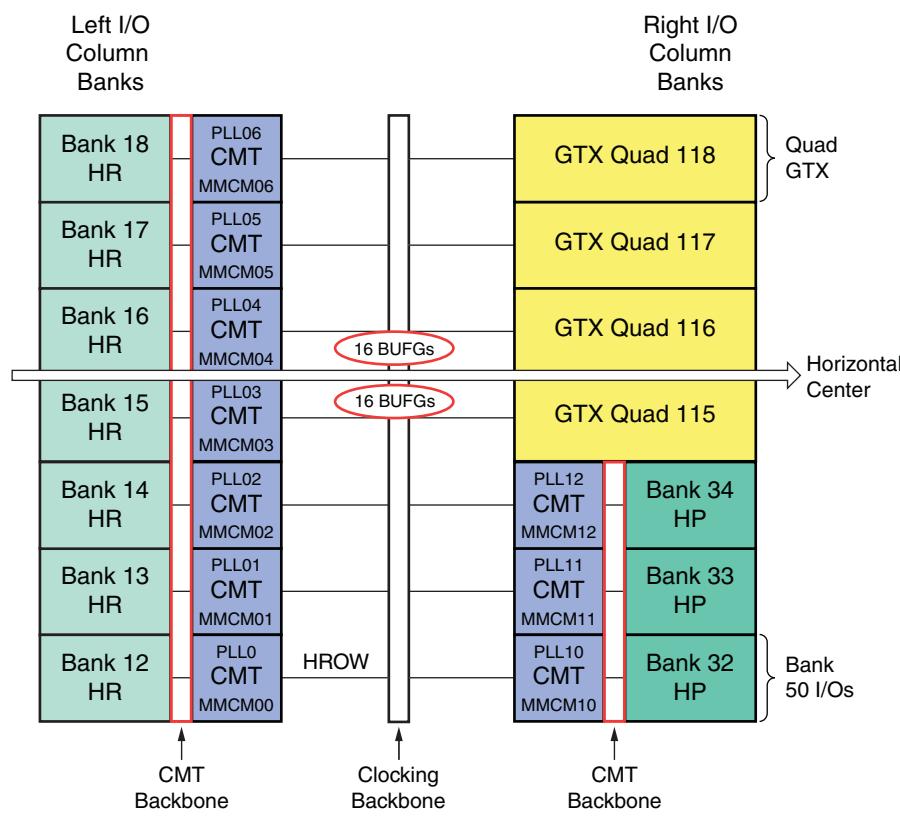

Figure 1-13: XC7K325T and XQ7K325T Banks

XC7K355T Banks

Figure 1-14 shows the I/O and transceiver banks for the XC7K355T.

FFG901 and FFV901 Package

All HR I/O banks and the GTX Quads are fully bonded out in this package.

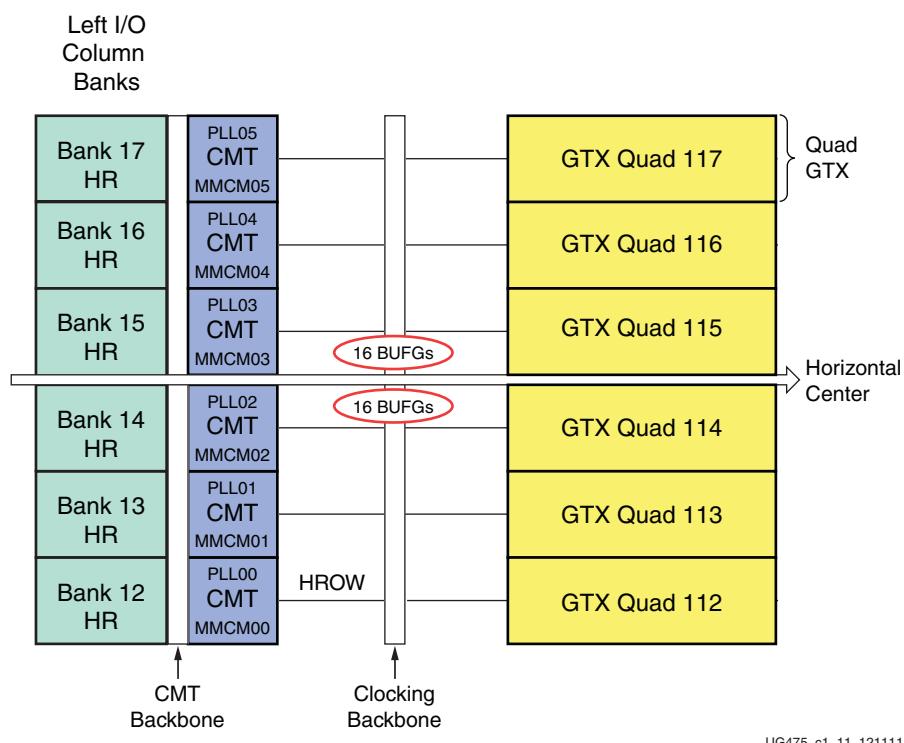

Figure 1-14: XC7K355T Banks

XC7K410T and XQ7K410T Banks

Figure 1-15 shows the I/O and transceiver banks for the XC7K410T and XQ7K410T.

FBG676, FBV676, FFG676, FFV676, and RF676 Packages

- HR I/O banks 17 and 18 are not bonded out.
- All HP I/O banks are fully bonded out.
- GTX Quads 117 and 118 are not bonded out.

FBG900, FBV900, FFG900, FFV900, and RF900 Packages

All HR and HP I/O banks and the GTX Quads are fully bonded out in these packages.

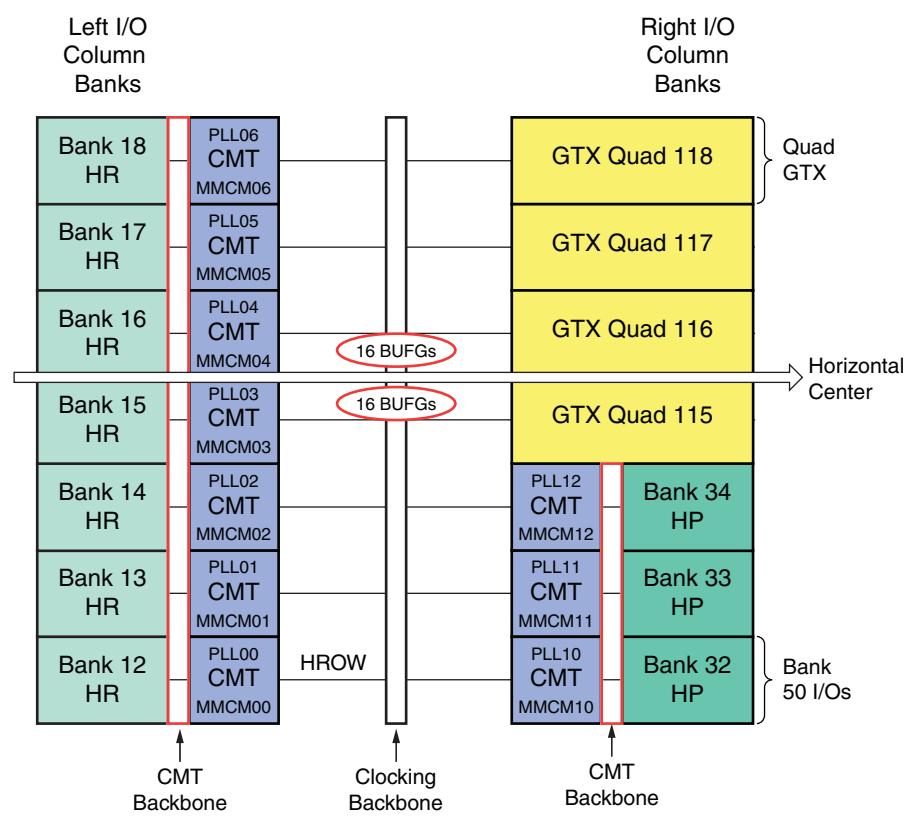

Figure 1-15: XC7K410T and XQ7K410T Banks

XC7K420T Banks

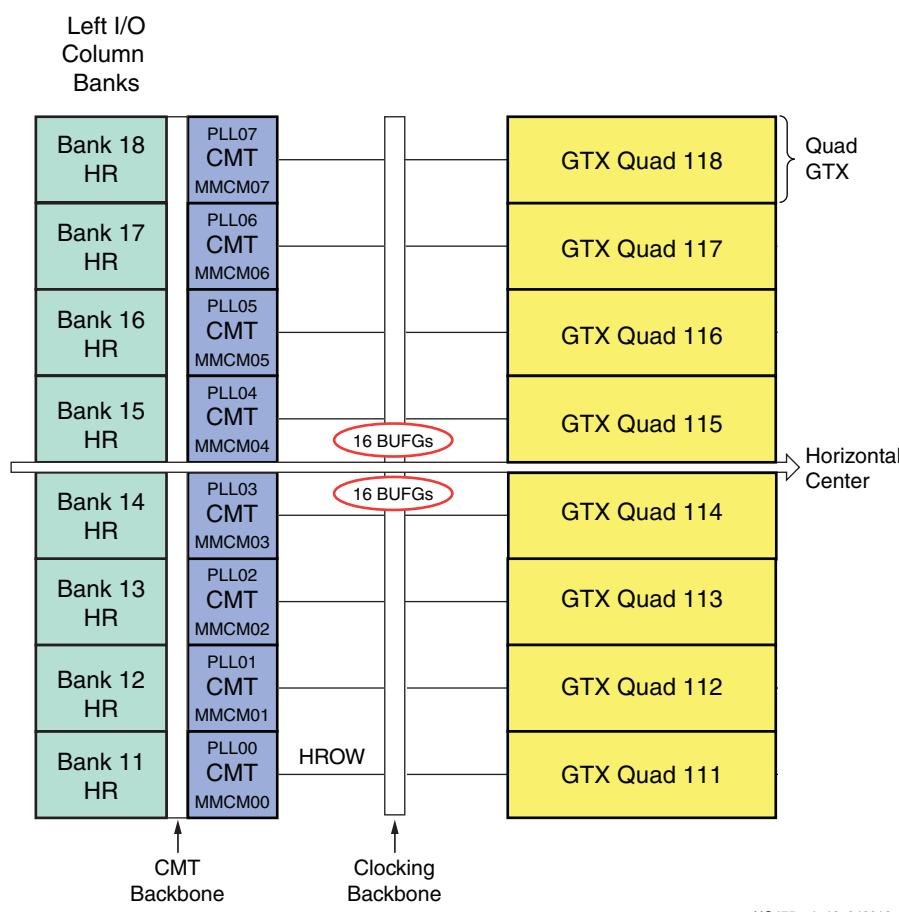

Figure 1-16 shows the I/O and transceiver banks for the XC7K420T.

FFG901 and FFV901 Package

- HR I/O bank 18 is not fully bonded out.
- GTX Quad 118 is not bonded out.

FFG1156 and FFV1156 Package

All HR I/O banks and the GTX Quads are fully bonded out in this package.

XC7VX485T and XQ7VX485T Banks

Figure 1-22 shows the I/O and transceiver banks for the XC7VX485T and XQ7VX485T.

FFG1157 Package

- HP I/O banks 13 and 33 are not bonded out.
- GTX Quads 113, 119, 213, 214, 215, 216, 217, 218, and 219 are not bonded out.

FFG1158 Packages

- HP I/O banks 13, 18, 19, 33, 37, 38, and 39 are not bonded out.
- GTX Quads 113 and 213 are not bonded out.

FFG1761 and RF1761 Packages

- All HP I/O banks are fully bonded out in these packages.
- GTX Quads 213, 214, 215, 216, 217, 218, and 219 are not bonded out.

FFG1927 Package

- HP I/O banks 13 and 33 are not bonded out.
- All the GTX Quads are fully bonded out in this package.

FFG1930 and RF1930 Packages

- All HP I/O banks are fully bonded out in these packages.
- GTX Quads 119, 213, 214, 215, 216, 217, 218, and 219 are not bonded out.

XC7VX690T and XQ7VX690T Banks

Figure 1-24 shows the I/O and transceiver banks for the XC7VX690T and XQ7VX690T.

FFG1157 and RF1157 Packages

- HP I/O banks 10, 11, 12, 13, 30, 31, 32, and 33 are not bonded out.
- GTH Quads 110, 111, 112, 113, 119, 210, 211, 212, 213, 214, 215, 216, 217, 218, and 219 are not bonded out.

FFG1158 and RF1158 Packages

- HP I/O banks 10, 11, 12, 13, 18, 19, 30, 31, 32, 33, 37, 38, and 39 are not bonded out.
- GTH Quads 110, 111, 112, 113, 210, 211, 212, and 213 are not bonded out.

FFG1761 and RF1761 Packages

- HP I/O banks 10, 11, and 30 are not bonded out.
- GTH Quads 110, 210, 211, 212, 213, 214, 215, 216, 217, 218, and 219 are not bonded out.

FFG1926 Package

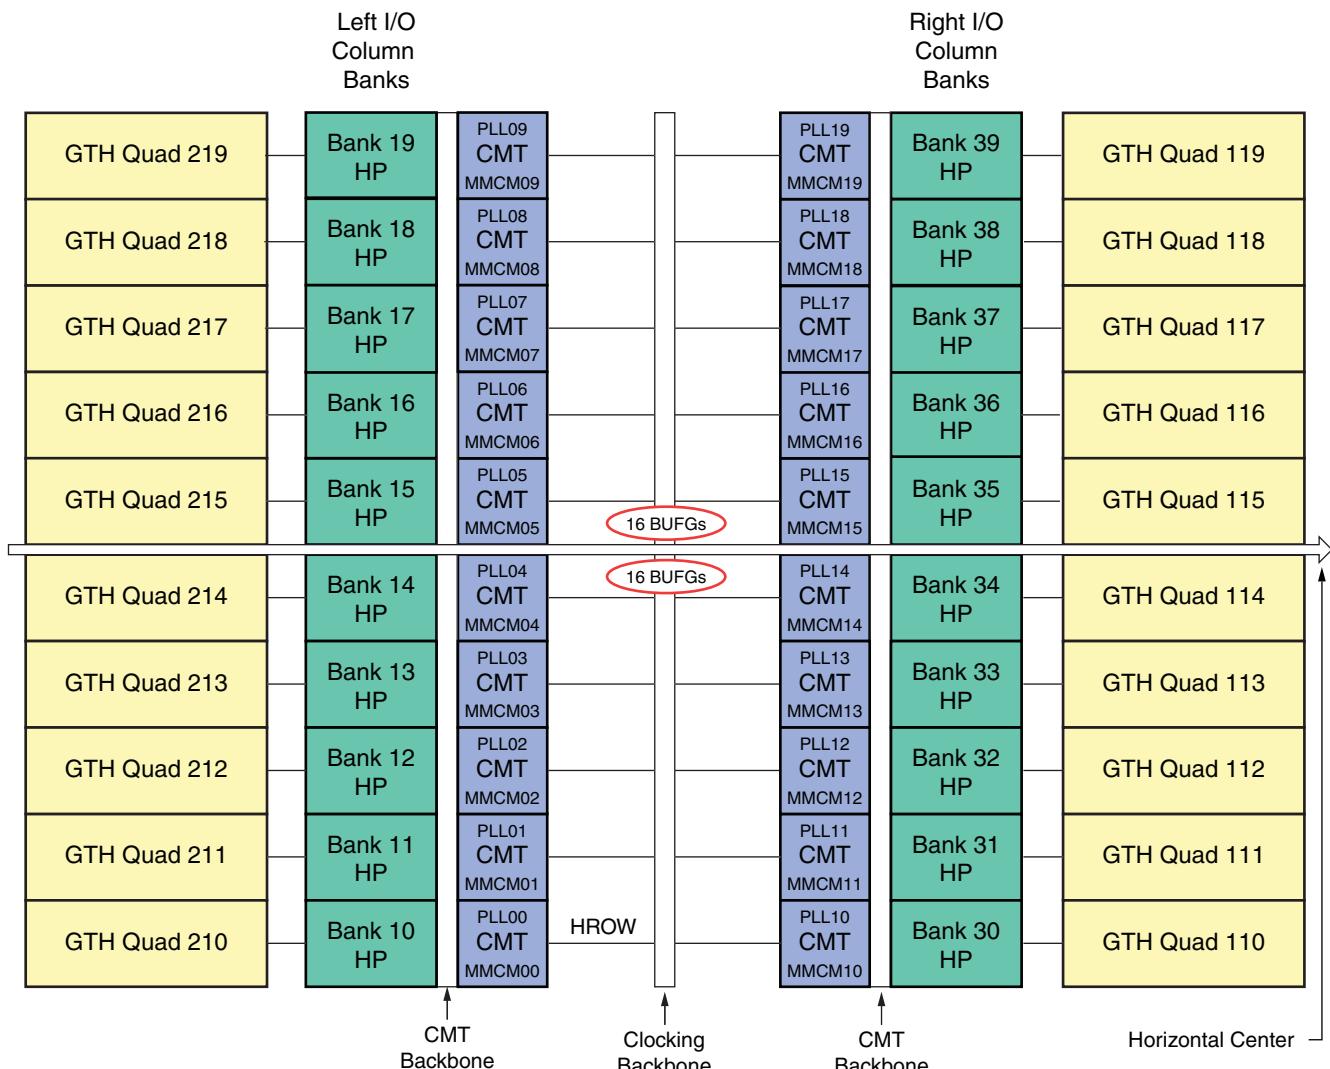

- HP I/O bank 17 is partially bonded out.
- HP I/O banks 18, 19, 37, 38, and 39 are not bonded out.
- GTH Quads 110, 119, 210, and 219 are not bonded out.

FFG1927 Package

- HP I/O banks 10, 11, 12, 13, 30, 31, 32, and 33 are not bonded out.
- All GTH Quads are fully bonded out in this package.

FFG1930 and RF1930 Packages

- All HP I/O banks are fully bonded out in these packages.
- GTH Quads 110, 111, 112, 119, 210, 211, 212, 213, 214, 215, 216, 217, 218, and 219 are not bonded out.

7 Series FPGAs Package Files

About ASCII Package Files

The ASCII files for each package include a comma-separated-values (CSV) version and a text version optimized for a browser or text editor. Each of the files consists of the following:

- Device/Package name (), date and time of creation
- Eight columns containing data for each pin:
 - Pin—Pin location on the package.
 - Pin Name—The name of the assigned pin.
 - Memory Byte Group—Memory byte group between 0 and 3. For more information on the memory byte group, see the [\(UG586\)](#).
 - Bank—Bank number.
 - V_{CCAUX} Group—Number corresponding to the V_{CCAUX_IO} power supply for the given pin. V_{CCAUX} is shown for packages with only one V_{CCAUX} group.
 - Super Logic Region—Number corresponding to the super logic region (SLR) in the devices implemented with stacked silicon interconnect (SSI) technology.
 - I/O Type—CONFIG, HR, HP, or GT (GTP, GTX, GTH) depending on the I/O type. For more information on the I/O type, see the [\(UG471\)](#).
 - No-Connect—This list of devices is used for migration between devices that have the same package size and are not connected at that specific pin.
- Total number of pins in the package.
- The package file links for the ruggedized packages have the same pinouts as the equivalent BGA packages.
 - RS pinouts use the SBG/SBV files (Artix®-7 devices)
 - RB pinouts use the FBG/FBV files (Artix-7 devices)
 - RF pinouts use the FFG/FFV files (Kintex®-7 and Virtex®-7 devices)

Package Specifications Designations

Package specifications are designated as evaluation only, engineering sample, or production. Each designation is defined as follows.

Evaluation Only

These package specifications are based on initial device specifications, package routability analysis and mechanical package construction. Package specifications with this designation are not stable and package pinouts are likely to change and these specifications should only be used for initial system level design feasibility.

Engineering Sample

These package specifications are based on a released package design and validated with ES engineering sample (ES) devices. Package specifications with this designation are considered stable, however some pinout and mechanical specifications might change prior to the production release of the particular device. Package pinouts with this designation are to be used for PCB and Vivado designs using ES devices.

Production

These package specifications are released coincident with production release of a particular device. Customers receive formal notification of any subsequent changes.

IMPORTANT:

ASCII Pinout Files

This chapter includes the pinout information tables for the following device/packages. For brevity, all the package selections are not listed in the link ZIP file names. For more information on available device and package choices, consult the device/package ordering information tables in the [\(DS180\)](#), or the [\(DS197\)](#). The XA devices are further outlined in the [Artix®-7 \(DS197\)](#) and [Spartan®-7 \(DS171\)](#). The XQ devices are outlined in the [\(DS185\)](#).

Note: All package files are ASCII files in TXT and CSV file format.

Device Diagrams

Summary

This chapter provides pinout, high-performance and high-range I/O bank, memory groupings, and power and ground placement diagrams for each 7 series (Artix®-7, Kintex®-7, Spartan®-7, and Virtex®-7) FPGA package/device combination.

- [Spartan-7 FPGAs Device Diagrams, page 74](#)
- [Artix-7 FPGAs Device Diagrams, page 97](#)
- [Kintex-7 FPGAs Device Diagrams, page 135](#)
- [Virtex-7 FPGAs Device Diagrams, page 169](#)

The figures provide a top-view perspective.

The symbols for the multi-function I/O pins are represented by only one of the available pin functions; with precedence (by functionality) in this order:

- ADV_B, FCS_B, FOE_B, MOSI, FWE_B, DOUT_CSO_B, CSI_B, PUDC_B, or RDWR_B
- RS0–RS1
- AD0P, AD0N–AD15P, AD15N
- EMCCLK
- VRN, VRP, or VREF
- D00–D31
- A00–A28
- DQS, MRCC, or SRCC

For example, a pin description such as IO_L8P_SRCC_12 is represented with a SRCC symbol, a pin description such as IO_L19N_T3_A09_D25_VREF_14 is represented with a VREF symbol, and a pin description such as IO_L21N_T3_DQS_A06_D22_14 is represented with a D0–D31 symbol.

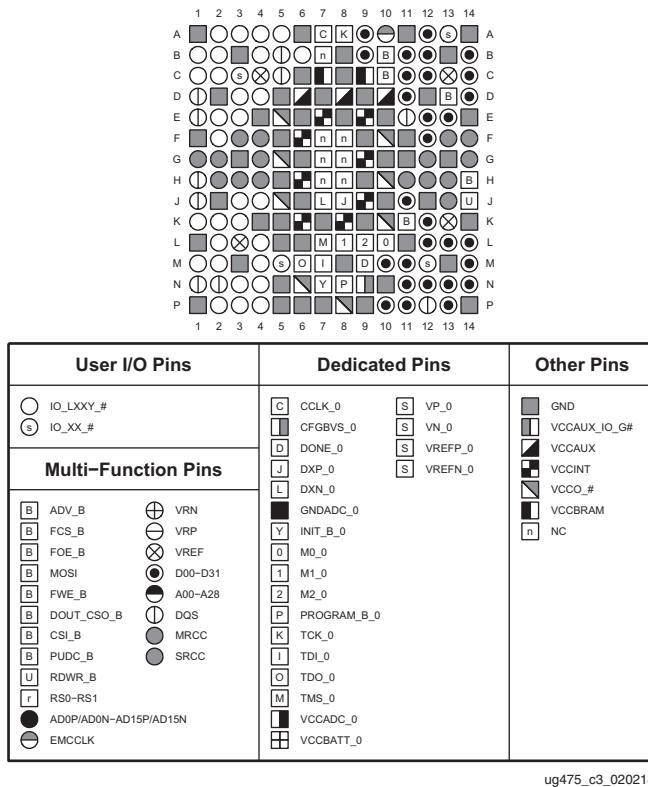

Note: For brevity, the prefixes for Xilinx commercial (XC) devices are used when the defense-grade (XQ) or the automotive (XA) could also be available.

Mechanical Drawings

Summary

This chapter provides mechanical drawings (package specifications) of the following 7 series (Artix®-7, Kintex®-7, Spartan®-7, and Virtex®-7 FPGA) packages.

Spartan-7 FPGAs

- CPGA196 (Spartan-7 FPGAs) Wire-Bond Chip-Scale BGA (0.5 mm Pitch), page 261
- FTGB196 (Spartan-7 FPGAs) Wire-Bond Chip-Scale BGA (1.0 mm Pitch), page 262
- CSGA225 (Spartan-7 FPGAs) Wire-Bond Chip-Scale BGA (0.8 mm Pitch), page 263
- CSGA324 (Spartan-7 FPGAs) Wire-Bond Chip-Scale BGA (0.8 mm Pitch), page 264
- FGGA484 (Spartan-7 FPGAs) Wire-Bond Fine-Pitch BGA (1.0 mm Pitch), page 265
- FGGA676 (Spartan-7 FPGAs) Wire-Bond Fine-Pitch BGA (1.0 mm Pitch), page 266

Artix-7 FPGAs

- CP236 and CPG236 (Artix-7 FPGAs) Wire-Bond Chip-Scale BGA (0.5 mm Pitch), page 267
- CPG238 (Artix-7 FPGAs: XC7A12T and XC7A25T) Wire-Bond Chip-Scale BGA (0.5 mm Pitch), page 268
- CS/CSG324 and CS/CSG325 (Artix-7 FPGAs) Wire-Bond Chip-Scale BGA (0.8 mm Pitch), page 269
- FT/FTG256 (Artix-7 FPGAs) Wire-Bond Fine-Pitch Thin BGA (1.0 mm Pitch), page 270
- SB484, SBG484, and SBV484 (Artix-7 FPGAs) Flip-Chip Lidless BGA (0.8 mm Pitch), page 271
- FB484, FBG484, and FBV484 (Artix-7 FPGAs) Flip-Chip Lidless BGA (1.0 mm Pitch), page 272
 - XC7A200T FB484, FBG484, and FBV484 Die Dimensions, page 273

- FB676, FBG676, and FBV676 (Artix-7 FPGAs) Flip-Chip Lidless BGA (1.0 mm Pitch), page 274
 - XC7A200T FB676, FBG676, and FBV676 Die Dimensions, page 275
- FG484 and FGG484 (Artix-7 FPGAs) Wire-Bond Fine-Pitch BGA (1.0 mm Pitch), page 276
- FG676 and FGG676 (Artix-7 FPGAs) Wire-Bond Fine-Pitch BGA (1.0 mm Pitch), page 277
- FF1156, FFG1156, and FFV1156 (Artix-7 FPGAs) Flip-Chip BGA (1.0 mm Pitch), page 278
- RB484 (Artix-7 FPGAs) Ruggedized Flip-Chip BGA (1.0 mm Pitch), page 279
- RS484 (Artix-7 FPGAs) Ruggedized Flip-Chip BGA (0.8 mm Pitch), page 280
- RB676 (Artix-7 FPGAs) Ruggedized Flip-Chip BGA (1.0 mm Pitch), page 281

Kintex-7 FPGAs

- FB484, FBG484, and FBV484 (Kintex-7 FPGAs) Flip-Chip Lidless BGA (1.0 mm Pitch), page 282
 - XC7K70T FB484, FBG484, and FBV484 Die Dimensions with Capacitor Locations, page 283
 - XC7K160T FB484, FBG484, and FBV484 Die Dimensions with Capacitor Locations, page 284
- FB676, FBG676, and FBV676 (Kintex-7 FPGAs) Flip-Chip Lidless BGA (1.0 mm Pitch), page 285
 - XC7K70T FB676, FBG676, and FBV676 Die Dimensions with Capacitor Locations, page 286
 - XC7K160T FB676, FBG676, and FBV676 Die Dimensions with Capacitor Locations, page 287
 - XC7K325T FB676, FBG676, and FBV676 Die Dimensions with Capacitor Locations, page 288
 - XC7K410T FB676, FBG676, and FBV676 Die Dimensions with Capacitor Locations, page 289
- FB900, FBG900, and FBV900 (Kintex-7 FPGAs) Flip-Chip Lidless BGA (1.0 mm Pitch), page 290
 - XC7K325T FB900, FBG900, and FBV900 Die Dimensions with Capacitor Locations, page 291
 - XC7K410T FB900, FBG900, and FBV900 Die Dimensions with Capacitor Locations, page 292
- FF676, FFG676, and FFV676 (Kintex-7 FPGAs) Flip-Chip BGA (1.0 mm Pitch), page 293

- There are two drawings for FF900 and FFG900 packages. They are device dependent:
 - FF900 and FFG900 (XC7K325T and XC7K410T) Flip-Chip BGA (1.0 mm Pitch) with Stamped Lid, page 294
 - FF900, FFG900, FFV900, FF901, FFG901, and FFV901 (Kintex-7 FPGAs) Flip-Chip BGA (1.0 mm Pitch), page 295
- There are two drawings for FF1156 and FFG1156 packages. They are device dependent:
 - FF1156 and FFG1156 (XC7K420T and XC7K480T) Flip-Chip BGA (1.0 mm Pitch) with Stamped Lid, page 296
 - FF1156, FFG1156, and FFV1156 (Kintex-7 FPGAs) Flip-Chip BGA (1.0 mm Pitch), page 297
- RF676 (Kintex-7 FPGAs) Flip-Chip BGA (1.0 mm Pitch), page 298
- RF900 (Kintex-7 FPGAs) Flip-Chip BGA (1.0 mm Pitch), page 299

Virtex-7 FPGAs

- FF1157, FFG1157, FFV1157, FF1158, FFG1158, and FFV1158 (Virtex-7 FPGAs) Flip-Chip BGA (1.0 mm Pitch), page 300
- FF1761 and FFG1761 (Virtex-7 FPGAs) Flip-Chip BGA (1.0 mm Pitch), page 301
- FFV1761 (Virtex-7 FPGAs) Flip-Chip BGA (1.0 mm Pitch), page 302
- FH1761 and FHG1761 (Virtex-7 T FPGAs) Flip-Chip BGA (1.0 mm Pitch), page 303
- FF1926, FFG1926, FF1927, FFG1927, FFV1927, FF1928, FFG1928, FF1930, and FFG1930 (Virtex-7 XT FPGAs) Flip-Chip BGA (1.0 mm Pitch), page 304
- FL1925, FLG1925, FL1926, FLG1926, FL1928, FLG1928, and FL1930, FLG1930 (Virtex-7 FPGAs) Flip-Chip BGA (1.0 mm Pitch), page 305
- RF1157 and RF1158 Flip-Chip BGA (Virtex-7 FPGAs) (1.0 mm Pitch), page 306
- RF1761 Flip-Chip BGA (Virtex-7 FPGAs) (1.0 mm Pitch), page 307
- RF1930 Flip-Chip BGA (Virtex-7 FPGAs) (1.0 mm Pitch), page 308

Thermal Specifications

Introduction

Most 7 series FPGAs are offered in thermally efficient flip-chip BGA packages. These 0.5 mm, 0.8 mm, and 1.0 mm flip-chip packages range in pin-count from the smaller 8 x 8 mm CPGA196 to the 45 x 45 mm FFG1930. This suite of packages is used to address the various power requirements of the 7 series devices. All 7 series devices are implemented in the 28 nm process technology (that is Artix®-7, Kintex®-7, Spartan®-7, and Virtex®-7 FPGAs).

Unlike features in an ASIC or a microprocessor, the combination of FPGA features used in a user application are not known to the component supplier. Therefore, it remains a challenge for Xilinx to predict the power requirements of a given FPGA when it leaves the factory. Accurate estimates are obtained when the board design takes shape. For this purpose, Xilinx offers and supports a suite of integrated device power analysis tools to help users quickly and accurately estimate their design power requirements. 7 series devices are supported similarly to previous FPGA products. The uncertainty of design power requirements makes it difficult to apply canned thermal solutions to fit all users. Therefore, Xilinx devices do not come with preset thermal solutions. The user's operating conditions dictate the appropriate solution.

Thermal Resistance Data

Table 5-1 shows the thermal resistance data for 7 series devices (grouped in the packages offered). The data includes junction-to-ambient in still air, junction-to-case, and junction-to-board data based on standard JEDEC four-layer measurements.

Note: The data in Table 5-1 is for device/package comparison purposes only. Do not apply directly to your system design. Attempts to recreate this data are only valid using the transient 2-phase measurement techniques outlined in JESD51-14.

The thermal data query for all available devices by package is available on the Xilinx website:

www.xilinx.com/cgi-bin/thermal/thermal.pl

Notes:

1. All $\theta_{JA\text{-Effective}}$ values assume no heat sink and include thermal dissipation through a standard JEDEC four-layer board. The Xilinx power estimation tools (Vivado® Power Analysis, and Xilinx Power Estimator), which require detailed board dimensions and layer counts, are useful for deriving more precise $\theta_{JA\text{-Effective}}$ values.

Thermal Management Strategy

As described in this section, Xilinx relies on a multi-pronged approach with regards to the heat-dissipating potential of 7 series devices.

Cavity-Up Plastic BGA Packages

BGA is a plastic package technology that utilizes area array solder balls at the bottom of the package to make electrical contact with the circuit board in the users system. The area array format of solder balls reduces package size considerably when compared to leaded products. It also results in imp

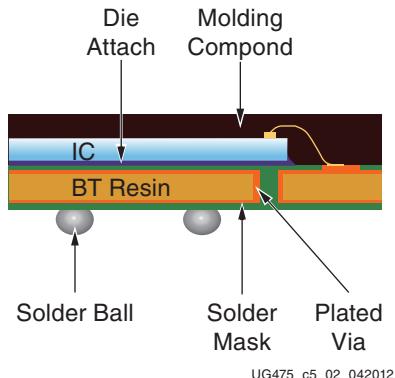

Figure 5-3: Rigid BT-Based Substrate Wire-Bond Packages

The key features/advantages of wire-bond packages are:

- An extremely small form factor which significantly reduces board area requirements for portable and wireless designs and PC add-in card applications.
- Lower inductance and lower capacitance
- The absence of thin, fragile leads found on other small package types
- A very thin, light-weight package

Flip-Chip Packages

For larger 7 series devices, Xilinx offers the flip-chip BGA packages, which present a low thermal path. These packages incorporate a heat spreader with additional thermal interface material (TIM), as shown in [Figure 5-4](#).

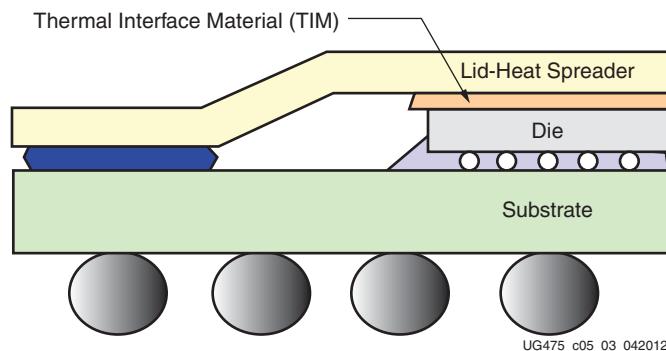

Figure 5-4: Heat Spreader with Thermal Interface Material

Materials with better thermal conductivity and consistent process applications deliver low thermal resistance up to the heat spreader. The junction-to-case thermal resistance (top of heat spreader) of all 7 series FPGA packages is typically less than $0.20^{\circ}\text{C}/\text{W}$. These packages deliver a low resistance platform for heat-sink applications.

A parallel effort to ensure optimized package electrical return paths produces the added benefit of enhanced power and ground plane arrangement in the packages. A boost in copper density on the planes improves the overall thermal conductivity through the laminate. In addition, the extra dense and distributed via fields in the package increase the vertical thermal conductivity. These packages offer up to 20% lower θ_{JB} compared to previous flip-chip packages.

System Level Heat Sink Solutions

To complete a comprehensive thermal management strategy, an overall thermal budget that includes custom or OEM heat sink solutions depends on the physical and mechanical constraints of the system. A heat-sink solution, managed by the system-level designer, should be tailored to the design and specific system constraints. This includes understanding the inherent device capabilities for delivering heat to the surface.

Thermal Interface Material

When installing heat sinks for Xilinx FPGAs, a suitable thermal interface material (TIM) must be used. This thermal material significantly aids the transfer of heat from the component to the heat sink. For optimum heat transfer, Xilinx recommends the use of thermal interface materials.

For lidless flip-chip BGAs, the surface of the silicon contacts the heat sink. For lidded flip-chip BGAs, the lid contacts the heat sink. The surface size of the lidless flip-chip BGA and lidded flip-chip BGA are different. Xilinx recommends a different type of thermal material for long-term use with each type of flip-chip BGA package.

Thermal interface material is needed because even the largest heat sink and fan cannot effectively cool an FPGA unless there is good physical contact between the base of the heat sink and the top of the FPGA. The surfaces of both the heat sink and the FPGA silicon are not absolutely smooth. This surface roughness is observed when examined at a microscopic level. Because surface roughness reduces the effective contact area, attaching a heat sink without a thermal interface material is not sufficient due to inadequate surface contact.

A thermal interface material such as phase-change material, thermal grease, or thermal pads fills these gaps and allows effective transference of heat between the FPGA die and the heat sink.

The selection of the thermal interface (TIM) between the package and the thermal management solution is critical to ensure the lowest thermal contact resistance. Therefore, the following parameters must be considered.

1. The flatness of the lid and the flatness of the contact surface of the thermal solution.

2. The applied pressure of the thermal solution on the package, which must be within the allowable maximum pressure that can be applied on the package.
3. The total thermal contact of the thermal interface material. This value is determined based on the parameters in [step 1](#) and [step 2](#), which are published in the data sheet of the thermal interface supplier.

Types of TIM

There are many type of TIM available for sale. The most commonly used thermal interface materials are listed.

- Thermal grease
- Thermal pads
- Phase change material
- Thermal paste
- Thermal adhesives
- Thermal tape

Guidelines for Thermal Interface Materials

Five factors affect the choice, use, and performance of the interface material used between the processor and the heat sink:

- [Thermal Conductivity of the Material](#)
- [Electrical Conductivity of the Material](#)
- [Spreading Characteristics of the Material](#)
- [Long-Term Stability and Reliability of the Material](#)
- [Ease of Application](#)
- [Applied Pressure from Heat Sink to the Package via Thermal Interface Materials](#)

Thermal Conductivity of the Material

Thermal conductivity is the quantified ability of any material to transfer heat. The thermal conductivity of the interface material has a significant impact on its thermal performance. The higher the thermal conductivity, the more efficient the material is at transferring heat. Materials that have a lower thermal conductivity are less efficient at transferring heat, causing a higher temperature differential to exist across the interface. To overcome this less efficient heat transfer, a better cooling solution (typically, a more costly solution) must be used to achieve the desired heat dissipation.

Electrical Conductivity of the Material

Some metal-based TIM compounds are electrically conductive. Ceramic-based compounds are typically not electrically conductive. Manufacturers produce metal-based compounds with low-electrical conductivity, but some of these materials are not completely electrically inert. Metal-based thermal compounds are not hazardous to the FPGA die itself, but other elements on the FPGA or motherboard can be at risk if they become contaminated by the compound. For this reason, Xilinx does not recommend the use of electrically conductive thermal interface material.

Spreading Characteristics of the Material

The spreading characteristics of the thermal interface material determines its ability, under the pressure of the mounted heat sink, to spread and fill in or eliminate the air gaps between the FPGA and the heat sink. Because air is a very poor thermal conductor, the more completely the interface material fills the gaps, the greater the heat transference.

Long-Term Stability and Reliability of the Material

The long-term stability and reliability of the thermal interface material is described as the ability to provide a sufficient thermal conductance even after an extended time or extensive. Low-quality compounds can harden or leak out over time (the pump-out effect), leading to overheating or premature failure of the FPGA. High-quality compounds provide a stable and reliable thermal interface material throughout the lifetime of the device. Thermal greases with higher viscosities are typically more resistant to pump out effects on lidless devices.

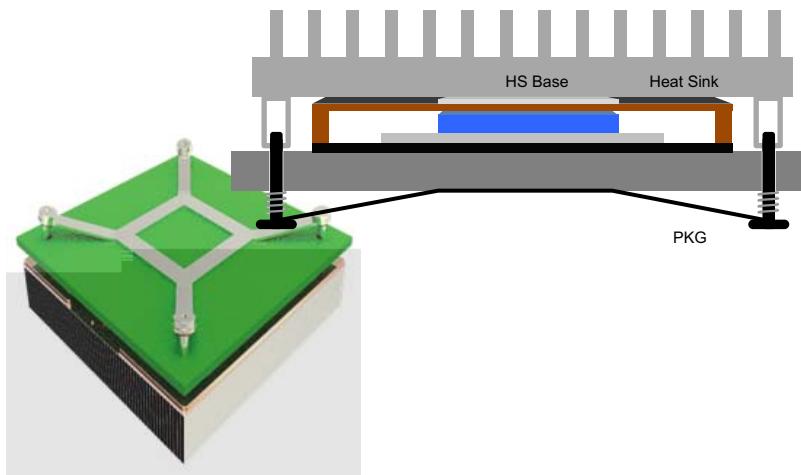

Ease of Application

A spreadable thermal grease requires the surface mount supplier to carefully use the appropriate amount of material. Too much or too little material can cause problems. The thermal pad is a fixed size and is therefore easier to apply in a consistent manner.

Applied Pressure from Heat Sink to the Package via Thermal Interface Materials

Xilinx recommends that the applied pressure on the package be in the range of 20 to 40 PSI for optimum performance of the thermal interface material (TIM) between the package and the heat sink. Thermocouples should not be present between the package and the heat sink, as their presence will degrade the thermal contact and result in incorrect thermal measurements.

Xilinx recommends using dynamic mounting around the four corners of the device package. On the PCB, use a bracket clip as part of the heat sink attachment to provide mechanical package support. See [Figure 5-5](#).

X15431-050217

Figure 5-5: Dynamic Mounting and Bracket Clips on Heat Sink Attachment

Heat Sink Removal Procedure

The heat spreader on the package provides mechanical protection for the die and serves as the primary heat dissipation path. It is attached with an epoxy adhesive to provide the necessary adhesion strength to hold the package together. For an application in which an external heat sink subjects the lid adhesion joint to continuous tension or shear, extra support might be required.

In addition, if the removal of an attached external heat sink subjects the joint to tension, torque, or shear, care should be exercised to ensure that the lid itself does not come off. In such cases, it has been found useful to use a small metal blade or metal wire to break the lid to heat sink joint from the corners and carefully pry the heat sink off. The initial cut should reach far enough so that the blade has leverage to exert upward pressure against the heat sink. Contact the heat sink and heat sink adhesive manufacturer for more specific recommendations on heat sink removal.

Soldering Guidelines

To implement and control the production of surface-mount assemblies, the dynamics of the solder reflow process and how each element of the process is related to the end result must be thoroughly understood.

Note: Xilinx recommends that customers qualify their custom PCB assembly processes using package samples.

The primary phases of the reflow process are:

1. Melting the particles in the solder paste
2. Wetting the surfaces to be joined
3. Solidifying the solder into a strong metallurgical bond

The peak reflow temperature of a plastic surface-mount component (PSMC) body should not be more than 250°C maximum (260°C for dry rework only) for Pb-free packages (220°C for eutectic packages), and is package size dependent. For multiple BGAs in a single board and because of surrounding component differences, Xilinx recommends checking all BGA sites for varying temperatures.

The infrared reflow (IR) process is strongly dependent on equipment and loading. Components might overheat due to lack of thermal constraints. Unbalanced loading can lead to significant temperature variation on the board. These guidelines are intended to assist users in avoiding damage to the components; the actual profile should be determined by those using these guidelines. For complete information on package moisture / reflow classification and package reflow conditions, refer to the Joint IPC/JEDEC Standard J-STD-020C.

Sn/Pb Reflow Soldering

Figure 5-6 shows typical conditions for solder reflow processing of Sn/Pb soldering using IR/convection. Both IR and convection furnaces are used for BGA assembly. The moisture sensitivity of PSMCs must be verified prior to surface-mount flow.

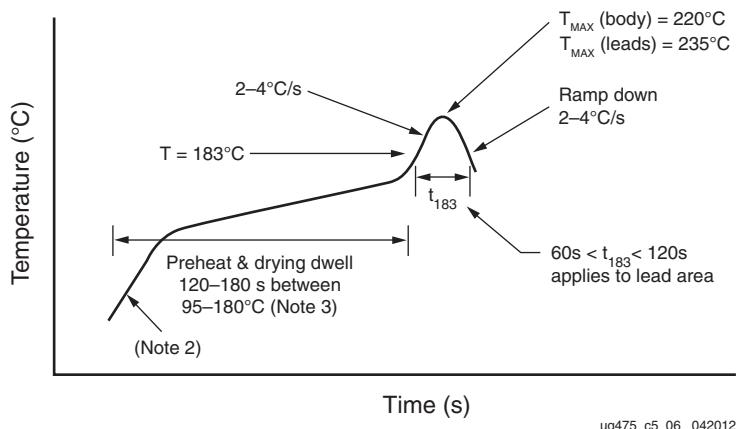

Figure 5-6: Typical Conditions for IR Reflow Soldering of Sn/Pb Solder

Notes for Figure 5-6

1. Maximum temperature range = 220°C (body). Minimum temperature range before 205°C (leads/balls).
2. Preheat drying transition rate 2–4°C/s
3. Preheat dwell 95–180°C for 120–180 seconds
4. IR reflow must be performed on dry packages

Pb-Free Reflow Soldering

Xilinx uses SnAgCu solder balls for BGA packages. In addition, suitable material are qualified for the higher reflow temperatures (250°C maximum, 260°C for dry rework only) required by Pb-free soldering processes.

Xilinx does not recommend soldering SnAgCu BGA packages with SnPb solder paste using a Sn/Pb soldering process. Traditional Sn/Pb soldering processes have a peak reflow temperature of 220°C. At this temperature range, the SnAgCu BGA solder balls do not properly melt and wet to the soldering surfaces. As a result, reliability and assembly yields can be compromised.

The optimal profile must take into account the solder paste/flux used, the size of the board, the density of the components on the board, and the mix between large components and smaller, lighter components. Profiles should be established for all new board designs using thermocouples at multiple locations on the component. In addition, if there is a mixture of devices on the board, then the profile should be checked at various locations on the board.

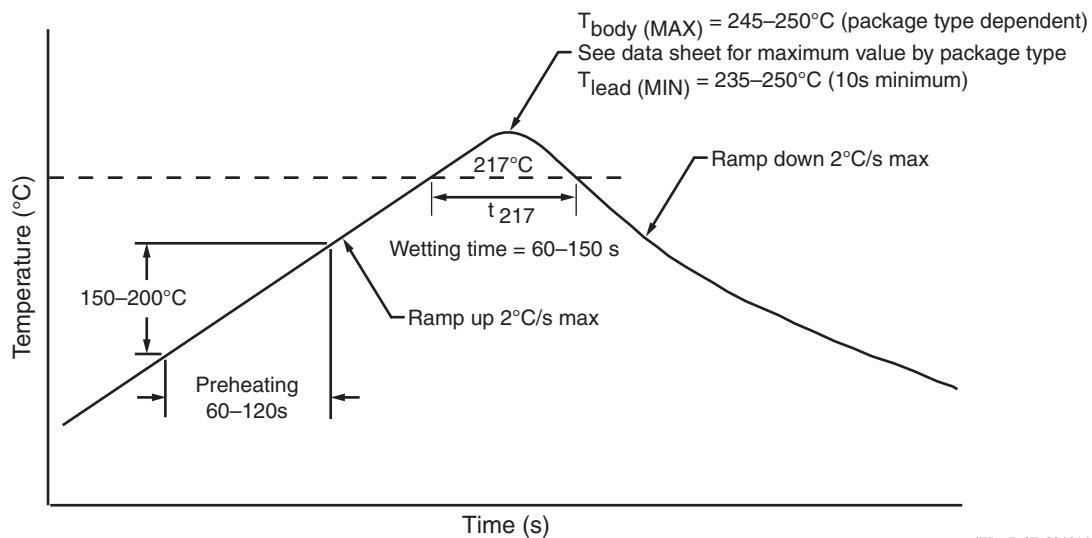

Ensure that the minimum reflow temperature is reached to reflow the larger components and at the same time, the temperature does not exceed the threshold temperature that might damage the smaller, heat sensitive components.

Table 5-2 and Figure 5-7 provide guidelines for profiling Pb-free solder reflow.

In general, a gradual, linear ramp into a spike has been shown by various sources to be the optimal reflow profile for Pb-free solders (Figure 5-7). SAC305 alloy reaches full liquidus temperature at 235°C. When profiling, identify the possible locations of the coldest solder joints and ensure that those solder joints reach a minimum peak temperature of 235°C for at least 10 seconds. It might not be necessary to ramp to peak temperatures of 260°C and above. Reflowing at high peak temperatures of 260°C and above can damage the heat sensitive components and cause the board to warp. Users should reference the latest IPC/JEDEC J-STD-020 standard for the allowable peak temperature on the component body. The allowable peak temperature on the component body is dependent on the size of the component. Refer to Table 5-2 for peak package reflow body temperature information. In any case, use a reflow profile with the lowest peak temperature possible.

Table 5-2: Pb-Free Reflow Soldering Guidelines

Profile Feature	Convection, IR/Convection
Ramp-up rate	2°C/s maximum
Preheat temperature 150°–200°C	60–120 seconds
Temperature maintained above 217°C	60–150 seconds (60–90 seconds typical)
Time within 5°C of actual peak temperature	30 seconds maximum
Peak temperature (lead/ball)	235°C minimum, 245°C typical (depends on solder paste, board size, components mixture)
Peak temperature (body)	245°C–250°C, package body size dependent (reference Table 5-3)
Ramp-down rate	2°C/s maximum
Time 25°C to peak temperature	3.5 minutes minimum, 5.0 minutes typical, 8 minutes maximum

ug475_c5_07_091614

	RF676 RF900 RF1157 RF1158 RF1761 RF1930	225°C	4

Notes:

- See specific 7 series device data sheets at [Xilinx Documentation](#).

For sophisticated boards with a substantial mix of large and small components, it is critical to minimize the ΔT across the board ($<10^\circ\text{C}$) to minimize board warpage and thus, attain higher assembly yields. Minimizing the ΔT is accomplished by using a slower rate in the warm-up and preheating stages. Xilinx recommends a heating rate of less than $1^\circ\text{C}/\text{s}$ during the preheating and soaking stages, in combination with a heating rate of not more than $2^\circ\text{C}/\text{s}$ throughout the rest of the profile.

It is also important to minimize the temperature gradient on the component, between top surface and bottom side, especially during the cooling down phase. The key is to optimize cooling while maintaining a minimal temperature differential between the top surface of the package and the solder joint area. The temperature differential between the top surface

of the component and the solder balls should be maintained at less than 7°C during the critical region of the cooling phase of the reflow process. This critical region is in the part of the cooling phase where the balls are not completely solidified to the board yet, usually between the 200°C–217°C range. To efficiently cool the parts, divide the cooling section into multiple zones, with each zone operating at different temperatures.

Post Reflow/Cleaning/Washing

Many PCB assembly subcontractors use a no-clean process in which no post-assembly washing is required. Although a no-clean process is recommended, if cleaning is required, Xilinx recommends a water-soluble paste and a washer using a deionized-water. Baking after the water wash is recommended to prevent fluid accumulation.

Cleaning solutions or solvents are not recommended because some solutions contain chemicals that can compromise the lid adhesive, thermal compound, or components inside the package.

Conformal Coating

Xilinx has no information about the reliability of flip-chip BGA packages on a board after exposure to conformal coating. Any process using conformal coating should be qualified for the specific use case to cover the materials and process steps.

Note: Xilinx does not recommend using Toluene-based conformal coatings because they can weaken the lid adhesive used in Xilinx packages.

Package Marking

Introduction

All 7 series devices (Spartan®-7, Artix®-7, Kintex®-7, and Virtex®-7 FPGAs) have package top-markings similar to the examples shown in [Figure 6-1](#), [Figure 6-2](#), [Figure 6-3](#), and [Figure 6-4](#). The markings are explained in [Table 6-1](#).

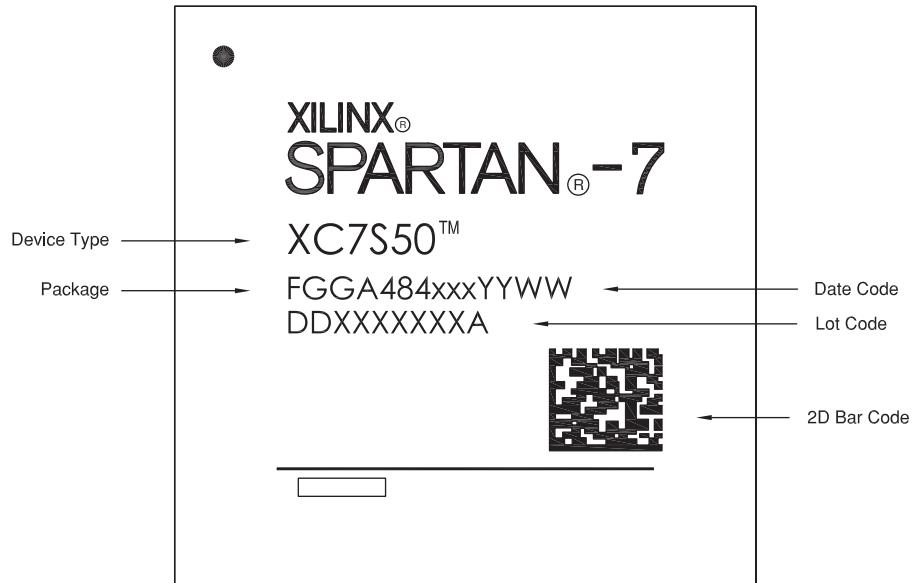

Figure 6-1: Spartan-7 Device Package Marking

Table 6-1: Xilinx Device Marking Definition—Example

Item	Definition
Xilinx Logo	Xilinx logo, Xilinx name with trademark, and trademark-registered status.
Pb-free Character	For FFG, FBG, or SBG packages, a Pb-free character is marked in the upper right corner of the device to denote that the device is manufactured using a lead-free material set as described in (XCN16022) .
Family Brand Logo	Device family name with trademark and trademark-registered status. This line is optional and could appear blank.
1st Line	Device type.
2nd Line	Package code, circuit design revision, the location code for the wafer fab, the geometry code, and date code. A (or V) in the third letter of a package code indicates a Pb-free RoHS compliant package. For more details on Xilinx Pb-Free and RoHS Compliant Products, see: www.xilinx.com/pbfree .
3rd Line	Ten alphanumeric characters for Assembly, Lot, and Step information. The last digit is usually an or an if a stepping version does not exist.

Table 6-1: Xilinx Device Marking Definition—Example (Cont'd)

Item	Definition	
	When marked, this line describes the device speed grade and temperature range. For more information on the ordering codes, see the (DS180) .	
4th Line	L2E	The L indicates a -2LE device. The -2LE speed grade offers reduced maximum power consumption. Artix-7 and Kintex-7 FPGAs are capable of operating at lower core voltage. The E is for the extended temperature operating range. For more information, see the specific device data sheets at: 7 series FPGAs .
	1C xxxx	The C indicates the SCD for the device. An SCD is a special ordering code that is not always marked in the device top mark.
	1C ES	The addition of an S indicates an Engineering Sample.
	This line is not marked on some devices. Refer to the bar code for device speed grade and temperature range information.	
Bar Code	A device-specific bar code is marked on each device. Refer to the (XTP424) .	

Packing and Shipping

Introduction

The 7 series devices are packed in trays (Table 7-1). Trays are used to pack most of Xilinx surface-mount devices since they provide excellent protection from mechanical damage. In addition, they are manufactured using anti-static material to provide limited protection against ESD damage and can withstand a bake temperature of 125°C. The maximum operating temperature is 140°C.

Recommended PCB Design Rules for BGA Packages

BGA Packages

Xilinx provides the diameter of a land pad on the package side. This information is required prior to the start of the board layout so the board pads can be designed to match the component-side land geometry. The typical values of these land pads are described in [Figure A-1](#) and summarized in [Table A-1](#) for both 0.8 mm and 1.0 mm pitch packages. For Xilinx BGA packages, non-solder mask defined (NSMD) pads on the board are suggested to allow a clearance between the land metal (diameter L) and the solder mask opening (diameter M) as shown in [Figure A-1](#). An example of an NSMD PCB pad solder joint is shown in [Figure A-2](#). It is recommended to have the board land pad diameter with a 1:1 ratio to the package solder mask defined (SMD) pad for improved board level reliability.

The space between the NSMD pad and the solder mask as well as the actual signal trace widths and via dimensions depend on the capability of the PCB vendor. The cost of the PCB is higher when the line width and spaces are smaller.

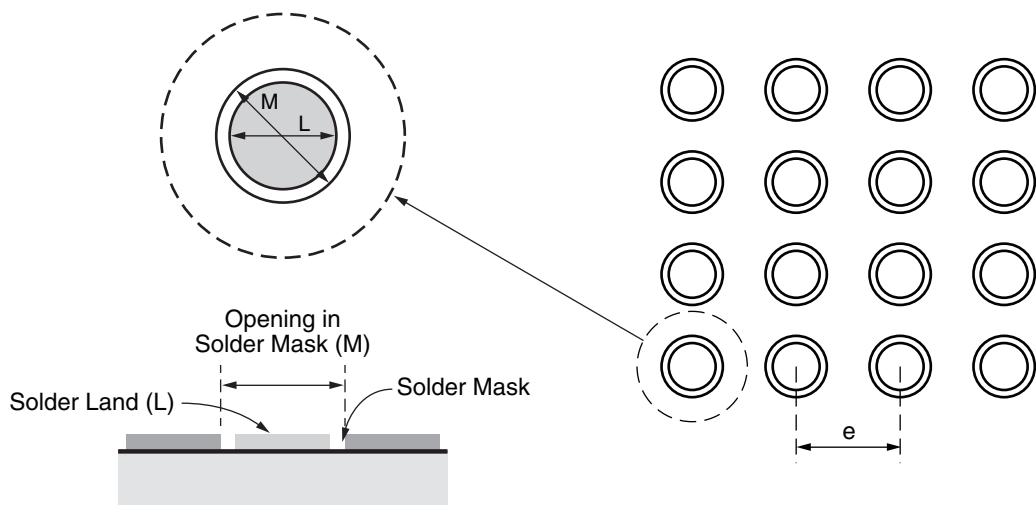

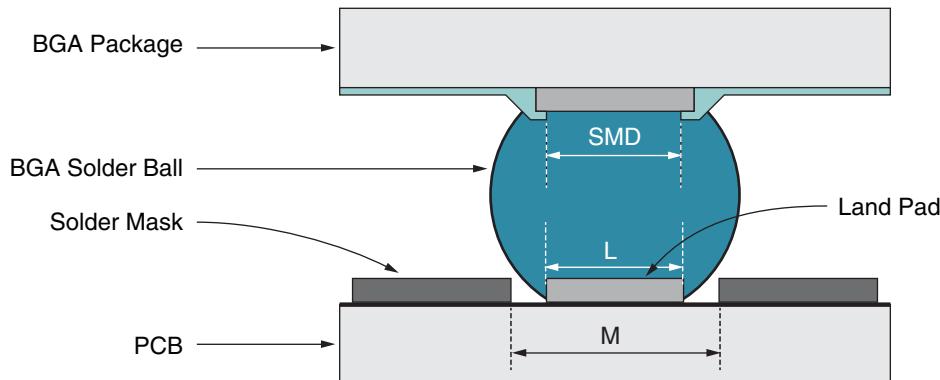

Figure A-1: Suggested Board Layout of Soldered Pads for BGA Packages

UG475_aA_02_110513

Figure A-2: Example of an NSMD PCB Pad Solder Joint

Table A-1: BGA Package Design Rules

Packages	0.5mm Pitch	0.8mm Pitch	1.0mm Pitch

1. Controlling dimension in mm.

Heat Sink Guidelines for Lidless Flip-Chip Packages

Heat Sink Attachments for Lidless Flip-chip BGA (FB/FBG/FBV and SB/SBG/SBV)

Heat sinks can be attached to the package in multiple ways. For heat to dissipate effectively, the advantages and disadvantages of each heat sink attachment method must be considered. Factors influencing the selection of the heat sink attachment method include the package type, contact area of the heat source, and the heat sink type.

Silicon and Decoupling Capacitors Height Consideration

When designing heat sink attachments for lidless flip-chip BGA packages, the height of the die above the substrate and also the height of decoupling capacitors must be considered (Figure B-1). This is to prevent electrical shorting between the heat sink (metal) and the decoupling capacitors.

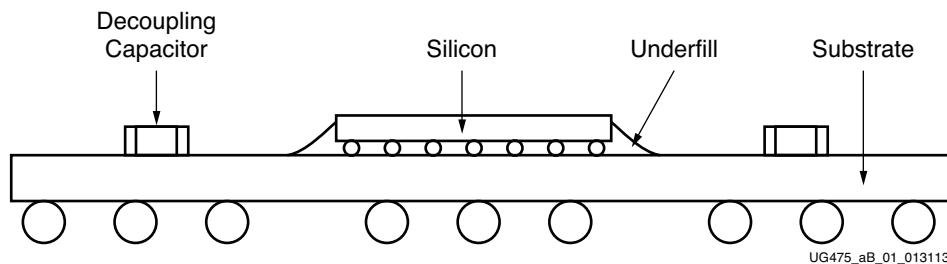

Figure B-1: Cross Section of Lidless Flip-chip BGA

Types of Heat Sink Attachments

There are six main methods for heat sink attachment. [Table B-1](#) lists their advantages and disadvantages.

- [Thermal tape](#)
- [Thermally conductive adhesive or glue](#) (epoxy)
- [Wire form Z-clips](#)
- [Plastic clip-ons](#)
- [Threaded stand-offs \(PEMs\) and compression springs](#)
- [Push-pins and compression springs](#)

Table B-1: Heat Sink Attachment Methods

Attachment Method	Advantages	Disadvantages
Thermal tape	<ul style="list-style-type: none"> • Generally easy to attach and is inexpensive. • Lowest cost approach for aluminum heat sink attachment. • No additional space required on the PCB. 	<ul style="list-style-type: none"> • The surfaces of the heat sink and the chip must be very clean to allow the tape to bond correctly. • Because of the small contact area, the tape might not provide sufficient bond strength. • Tape is a moderate to low thermal conductor that could affect the thermal performance.
Thermally conductive adhesive or glue	<ul style="list-style-type: none"> • Outstanding mechanical adhesion. • Fairly inexpensive, costs a little more than tape. • No additional space required on the PCB. 	<ul style="list-style-type: none"> • Adhesive application process is challenging and it is difficult to control the amount of adhesive to use. • Difficult to rework. • Because of the small contact area, the adhesive might not provide sufficient bond strength.
Wire form Z-clips	<ul style="list-style-type: none"> • It provides a strong and secure mechanical attachment. In environments that require shock and vibration testing, this type of strong mechanical attachment is necessary. • Easy to apply and remove. Does not cause the semiconductors to be destroyed (epoxy and occasionally tape can destroy the device). • It applies a preload onto the thermal interface material (TIM). Pre-loads actually improve thermal performance. 	<ul style="list-style-type: none"> • Requires additional space on the PCB for anchor locations.

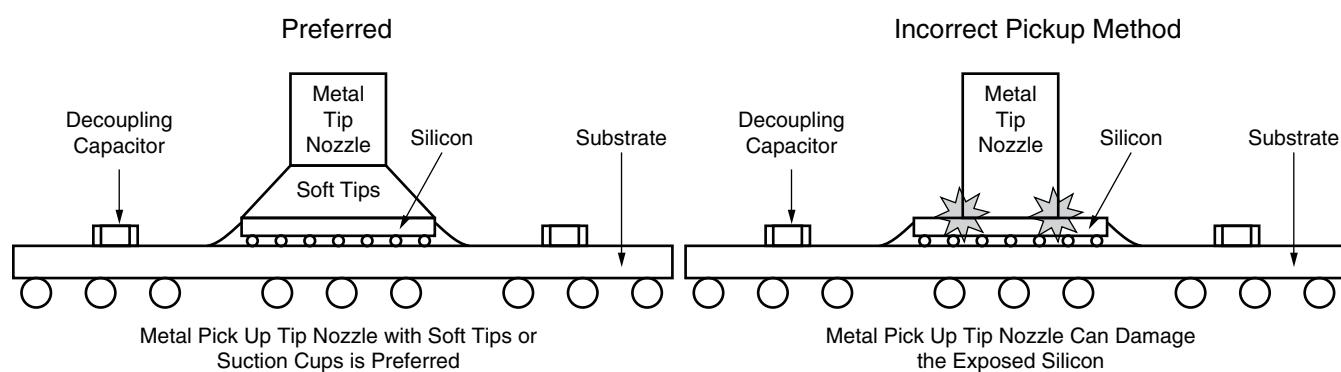

Table B-1: Heat Sink Attachment Methods (*Cont'd*)

Attachment Method	Advantages	Disadvantages
Plastic clip-ons	<ul style="list-style-type: none"> Suitable for designs where space on the PCB is limited. Easy to rework by allowing heat sinks to be easily removed and reapplied without damaging the PCB board. Can provide a strong enough mechanical attachment to pass shock and vibration test. 	<ul style="list-style-type: none"> Needs a keep out area around the silicon devices to use the clip. Caution is required when installing or removing clip-ons because localized stress can damage the solder balls or chip substrate.
Threaded stand-offs (PEMs) and compression springs	<ul style="list-style-type: none"> Provides stable attachments to heat source and transfers load to the PCB, backing plate, or chassis. Suitable for high mass heat sinks. Allows for tight control over mounting force and load placed on chip and solder balls. 	<ul style="list-style-type: none"> Holes are required in the PCB taking valuable space that can be used for trace lines. Tends to be expensive, especially since holes need to be drilled or predrilled onto the PCB board to use stand-offs.
Push-pins and compression springs	<ul style="list-style-type: none"> Provides a stable attachment to a heat source and transfers load to the PCB. Allows for tight control over mounting force and load placed on chip and solder balls. 	<ul style="list-style-type: none"> Requires additional space on the PCB for push-pin locations.

Heat Sink Attachment

Component Pick-up Tool Consideration

For pick-and-place machines to place lidless flip-chip BGAs onto PCBs, Xilinx recommends using soft tips or suction cups for the nozzles. This prevents chipping, scratching, or even cracking of the bare die (Figure B-2).

UG475_aB_02_013113

Figure B-2: Recommended Method For Using Pick-up Tools

Heat Sink Attachment Process Considerations

After the component is placed onto the PCBs, when attaching a heat sink to the lidless package, the factors in Table B-2 must be carefully considered (see Figure B-3).

Table B-2: Heat Sink Attachment Considerations

Consideration(s)	Effect(s)	Recommendation(s)
In heat sink attach process, what factors can cause damage to the expose die and passive capacitors?	<ul style="list-style-type: none"> Uneven heat sink placement Uneven TIM thickness Uneven force applied when placing heat sink placement 	<ul style="list-style-type: none"> Even heat sink placement Even TIM thickness Even force applied when placing heat sink placement
Does the heat sink tilt or tip the post attachment?	Uneven heat sink placement will damage the silicon and can cause field failures.	<ul style="list-style-type: none"> Careful handling not to contact the heat sink with the post attachment. Use a fixture to hold the heat sink in place with post attachment until it is glued to the silicon.

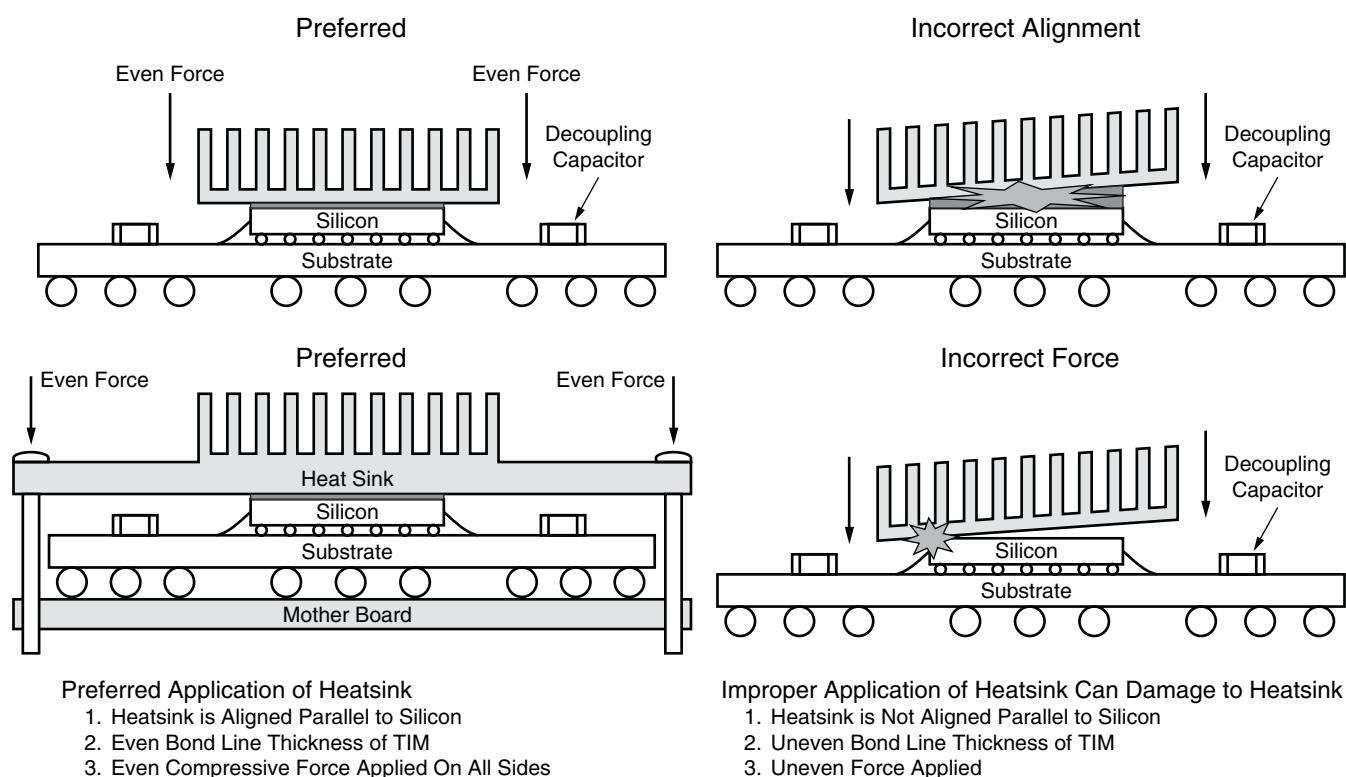

Figure B-3: Recommended Application of Heat Sink

UG475_aB_03_013113

Standard Heat Sink Attach Process with Thermal Conductive Adhesive

Prior to attaching the heat sink, the FPGA needs be surface mounted on the motherboard.

1. Place the motherboard into a jig or a fixture to hold the motherboard steady to prevent any movement during the heat sink attachment process.
2. Thermoset material (electrically non-conductive) is applied over the backside surface of silicon in a pattern using automated dispensing equipment. Automated dispensers are often used to provide a stable process speed at a relatively low cost. The optimum dispensing pattern needs to be determined by the SMT supplier.

Note: Minimal volume coverage of the backside of the silicon can result in non-optimum heat transfer.

3. The heat sink is placed on the backside of the silicon with a pick and place machine. A uniform pressure is applied over the heat sink to the backside of the silicon. As the heat sink is placed, the adhesive spreads to cover the backside silicon. A force transducer is normally used to measure and limit the placement force.
4. The epoxy is cured with heat at a defined time.

Note: The epoxy curing temperature and time is based on manufacturer's specifications.

Standard Heat Sink Attach Process with Thermal Adhesive Tape

Prior to attaching the heat sink, the FPGA needs be surface mounted on the motherboard.

1. Place the motherboard into a jig or a fixture to hold the motherboard steady to prevent any movement during the heat sink attachment process.
2. Thermal adhesive tape cut to the size of the heat sink is applied on the underside of the heat sink at a modest angle with the use of a squeegee rubber roller. Apply pressure to help reduce the possibility of air entrapment under the tape during application.
3. The heat sink is placed on the backside of the silicon with a pick and place machine. A uniform pressure is applied over the heat sink to the backside of the silicon. As the heat sink is placed, the thermal adhesive tape is glued to the backside of the silicon. A force transducer is normally used to measure and limit the placement force.
4. A uniform and constant pressure is applied uniformly over the heat sink and held for a defined time.

Note: The thermal adhesive tape hold time is based on manufacturer's specifications.

Push-Pin and Shoulder Screw Heat Sink Attachment Process with Phase Change Material (PCM) Application

Prior to attaching the heat sink, the FPGA needs be surface mounted on the motherboard.

1. Place the motherboard into a jig or a fixture to hold the motherboard steady to prevent any movement during the heat sink attachment process.

Note: The jig or fixture needs to account for the push pin depth of the heat sink.

2. PCM tape, cut to the size of the heat sink, is applied on the underside of the heat sink at a modest angle with the use of a squeegee rubber roller. Apply pressure to help reduce the possibility of air entrapment under the tape during application.

3. Using the push-pin tool, heat sinks are applied over the packages ensuring a pin locking action with the PCB holes. The compression load from springs applies the appropriate mounting pressure required for proper thermal interface material performance.

Note: Heat sinks must not tilt during installation. This process cannot be automated due to the mechanical locking action which requires manual handling. The PCB drill hole tolerances need to be close enough to eliminate any issues concerning the heat sink attachment.
